Fifth Rwanda Population and Housing Census, 2022

Thematic Report

POPULATION PROJECTIONS

July, 2023

The Fifth Rwanda Population and Housing Census, 2022 (RPHC 2022) was implemented by the National Institute of Statistics of Rwanda (NISR). Fieldwork was conducted from 16th to 30th August, 2022.

Additional information about the 2022 RPHC may be obtained from the NISR:
P.O. Box 6139, Kigali, Rwanda; Telephone: (+250) 788 383 103/Toll free:4321
E-mail: info@statistics.gov.rw; Website: www.statistics.gov.rw.

FOREWORD

The Government of Rwanda, through the National Institute of Statistics of Rwanda (NISR), conducted the Fifth Rwanda Population and Housing Census in August 2022. The Census results provide updated demographic, social and economic indicators for policy formulation and planning to support the national development agenda. Census results will also help in tracking the implementation of national, regional, continental and global development goals, such as the National Strategy for Transformation (NST), the AU Agenda 2063, and the Sustainable Development Goals (SDGs).

The Population and Housing Census in Rwanda dates back to the year 1978 when the first ever-modern census was implemented. The second, third, and fourth censuses were carried out in 1991, 2002, and 2012 respectively. The 2022 Rwanda Population and Housing Census marks therefore the fifth in the series following the United Nations Recommendations to conduct a census every ten years.

Considering census' crucial importance for the planning process, the Government of Rwanda has made the Population and Housing Census a priority to be undertaken every 10 years and adopted the use of technologies for timely delivery of census results for use.

Results of the 2022 Population and Housing Census provide population numbers from national to the lowest administrative level, as well as demographic and socio-economic indicators at both national and district levels. The census remains the only national data collection exercise that can provide the lowest levels of disaggregation to support decentralised decision making across the country.

I would like, therefore, to take this opportunity to thank all stakeholders that contributed to the success of the 2022 Rwanda Population and Housing Census. They include Ministries and other Government institutions, international organizations such as the World Bank (WB), the European Union (EU), the United Nations Population Fund (UNFPA), One-UN, UN Women, UNICEF, UNECA, the United Kingdom AID (UKAID), ONS, the African Development Bank (AfDB), the USAID, ENABEL, PARIS 21 and others for their support in diverse ways.

My special thanks go to the local government leaders from the province to the village levels who contributed a lot to the success of the 2022 Rwanda Population and Housing Census. Exceptional gratitude goes also to all enumerators and all field personnel, who collected the information and all respondents for their cooperation and dedication. The National Institute of Statistics of Rwanda (NISR) deserves special appreciation for the excellent operational and coordination of all census activities.

I finally recommend that the invaluable information contained in the different thematic reports of the 5th Rwanda Population and Housing Census be used as updated evidence for all decision and policy making for the national, regional and global development programs.

Dr. Uzziel NDAGIJIMANA
Minister of Finance and Economic Planning

ACKNOWLEDGEMENTS

The National Institute of Statistics of Rwanda (NISR) is pleased to release the results of the Fifth Rwanda Population and Housing Census (RPHC5). The execution of different Census phases: preparatory works, data collection, data processing, tabulation and data analysis; spans for a period of about four years between 2020 and 2023.

NISR has produced several thematic reports to be of direct help to policy makers, planners, local authorities and other census users. The reports provide key information, mainly population size and distribution, education, settlement, population of particular interest (children, youth, women, elderly, etc.), and population projections to mention but a few. NISR expects that results from these reports supplemented by the district profile reports will meet the demand of census data users across board.

On this occasion, I would like to extend my sincere gratitude to the Government of Rwanda and development partners for availing financial, logistical and technical support to the 2022 RPHC. The NISR would like to appreciate all stakeholders who worked tirelessly with us to ensure that the 2022 Rwanda Population and Housing Census operation was successful.

Special recognition also goes to the Ministry of Finance and Economic Planning, Ministry of Defence, Ministry of Local Government, Ministry of Education, Ministry of Foreign Affairs, Ministry of ICT and Innovation, Ministry of Interior, Ministry of Health, Ministry in Charge of Emergency Management, the Rwanda National Police, Rwanda Correctional Services, Rwanda Biomedical Center (RBC), Rwanda Information Society Authority (RISA), Rwanda Utilities Regulatory Authority (RURA), Rwanda Public Procurement Authority (RPPA), Office of Government Spokesperson (OGS), and Rwanda Broadcasting Agency (RBA) for their direct involvement in awareness campaign, logistical and data collection operations.

I also wish to express my appreciation to the local government authorities and NISR staff for their excellent operational organization and to the tens of thousands of enumerators and supervisors for their painstaking efforts throughout the data collection phase.

Finally, to the people of Rwanda, residents, and visitors, your cooperation was crucial towards the success of the census.

Thank you.

MURANGWA Yusuf
Director General,
National Institute of Statistics of Rwanda

EXECUTIVE SUMMARY

Population projections are widely used virtually in all government and private sectors given that they are inevitable for informed decisions by policy makers at all levels especially during the intercensal period. This is particularly so for the case of Rwanda which is densely populated country with a high population growth rate.

Over the last two decades, the country has experienced rapid demographic and social changes. The overall objective of this report is to present reliable information on the various components of the projected population between 2022 and 2052 to decision-makers, planners and development partners and inform the Rwanda's vision 2050.

The standard cohort component method was applied in generating the Rwanda population projections based on the 2022 Fifth Population and Housing Census data. The projections were generated based on three scenarios (high, medium and low) formulated using assumptions regarding future course of fertility and mortality, and reflecting on past trends and other existing and future development policies. The medium assumption scenario is regarded as the most likely projection.

The 2022 RPHC recorded a total resident population of 13,246,394 people as of 15th August 2022, with a slightly higher representation of women (51.5%). Both fertility and mortality levels remain relatively high, although the rates have decreased substantially over the past two decades.

Indeed, under the current fertility conditions, a Rwandan woman would have 3.6 children on average at the end of her reproductive life when compared to a total fertility rate of 5.9 in 2002 and 4.0 in 2012. The level of mortality has declined considerably. In particular, infant mortality rate dropped considerably from 118 per 1000 live births in 1991 to 49 per 1000 in 2012, then to 29 per 1000 in 2022.

The results from the population projections demonstrate evidence that in the next 30 years, the Rwanda population is expected to be considerably different in terms of size, structure and composition than it is currently. At current level of the population growth (2.3%), the Rwanda population would double in 30 years.

Evolution of fertility and mortality

Regardless of the projection scenarios, fertility rates will decrease in the next 30 years. The current decline in fertility is assumed to continue over time with the

total fertility rate decreasing from 3.6 children per woman to 2.9 (high scenario), 2.6 (medium scenario) and 2.3 (low scenario). The annual number of births is projected to increase from 367,312 in 2022 to 465,194 in 2052 according to the medium scenario. Mortality will also decrease, irrespective of the projection scenarios and the life expectancy is most likely to continue increasing with a continuous effort to improve the wellbeing of the population.

According to the medium scenario, life expectancy at birth is likely to increase from 69.7 years to 78.0 years.

Size and density of future population

The Rwanda population is projected to increase from 13.2 million in 2022 to 24.2 million (high scenario), to 23.8 million (medium scenario), and to or 23.4 million (low scenario) by 2052.

The absolute difference between the assumption scenarios is trivial, which suggests that the future size of Rwandan population would be approximately 80% more than the current population.

A direct consequence of this evolution is the unprecedented increase in the population density, as high as 903 inhabitants per square kilometer according to the medium scenario in 2052.

The population age-structure depicted by the population pyramid of Rwanda in 2052 will be quite different from the one in 2022. The population will be less young with the median age increasing from 21 years in 2022 to 27 in 2052. The major change will be a decrease in the share of children aged 0-14 years in the total population, and an increase in the population aged 15 years and above. This reflects the demographic transition from high birth and death rates to lower ones and a demographic window for the country. This will yield a demographic dividend which is an economic benefit that the country would earn from an investment in the youthful population.

Evolution of the urban and rural population

The urban population is expected to increase from 27.9% in 2022 to 70% in 2052 as stated in the vision 2050. This rapid growth translates into an expected urban population that is multiplied by a factor of four in the next 30 years: 3.7 million in 2022 to 16.6 million, according to the medium scenario.

However, the rural population is expected to increase from 9.5 million in 2022 to: 9.6 million in 2026, then start decreasing up to 7.1 million in 2052 according to the medium scenario.

Both the urban and rural populations will be less younger with a median age increasing from 22 years to 27 years for the urban and from 20 years to 28 years for the rural between 2022 and 2052.

Evolution of some specific interventions target groups

The sizes of specific population sub-groups such as the school-age population, the working-age population, the health interventions group, the elderly, the children, youth, and the legal age-groups categories are expected to increase substantially over the next 30 years, especially in urban areas.

For instance, at the national level, the school-age population is expected to increase from 5.2 million of people aged 3-18 to 7.2 million between 2022 and 2052, equivalent to an increase of 39% with marked differences by place of residence.

The proportion of the working-age population aged 16-64 years in Rwanda is expected to increase from 56% in 2022 to 61% in 2052. This increase will be even higher in urban area where the working-age population is expected to increase fivefold in thirty years. In contrast, a decrease of the working-age population is expected in rural areas mainly due to urban population growth and rural-urban migration.

The size of the elderly aged 60 and above is expected to have tripled between 2022 and 2052. The increase is expected to be even more substantial in urban areas where the number of the elderly in 2052 is expected to be 9 times greater than in 2022; whereas in the rural areas, the increase is expected to be twofold.

The increase also varies by sex, regardless of the place of residence. The increase in relative terms is expected to be more accentuated among males than

females at national and rural levels than in urban areas.

For instance, at the national level, the increase in the male elderly population between 2022 and 2052 is expected to be 221% as compared to 178% among females.

Evolution of the private households

The number of private households increased from 2.4 million to 3.3 million between 2012 and 2022 and would increase to 5.3 million by 2032 and 7.9 million by 2052.

The number of private households will increase sixfold in urban area whereas in rural areas this increase will be only 83%. The mean size of the households will vary slightly, decreasing from 4.3 members per household to 4.1 in 2032 with little variations between urban and rural areas. The annual number of newly created households will increase continuously over time: from around 98,000 in 2023 up to about 198,000 in 2052.

Policy implications

A significant threat to population and development in Rwanda is the increasing land pressure. The country needs to put in place explicit policies to deal with the unavoidable and foreseeable population overcrowding aside from the current policies aimed at slowing down the population growth. The expected growth of the population would exacerbate pressure on land, settlements/housing, physical infrastructure and resources. This would imply revisiting urban planning, mode of construction, and monitoring related interventions within the high population growth context, while paying attention to the future development of new urban settlements including roads, transport networks, sewage disposal, environmental infrastructure, water and electricity supply, health and educational facilities and other essential community facilities.

The size and growth rate of future youth and working-age population will pose additional challenges in terms of generating sustainable employment and livelihood opportunities in both urban and rural areas of Rwanda.

This calls for essential investments in human capital development especially investment in education, health, and economic reforms so that the country has a healthy, well educated, and highly skilled labor

force that is gainfully employed as articulated in the Vision 2050.

The decline in fertility and improvements in adult and old age survival rates would imply that the future dependency ratio is expected to be sensitive to the decreasing number of children and increasing number of elderly people in the population. This would have implications on providing social support

and healthcare and living arrangements of the elderly population.

Consequently, there is great need to put in place appropriate strategies towards provision of social support, health care and living arrangements of the elderly population in both urban and rural areas but also retirement planning.

CHAPTER 1: OVERVIEW OF THE FIFTH RWANDA POPULATION AND HOUSING CENSUS

1.1. Context and justification

The history of the Population and Housing Census in Rwanda dates back in the 1970s. To date, five modern censuses have been successfully conducted in Rwanda: 1978, 1991, 2002, 2012 and 2022.

In line with the United Nations Decennial Census Programme, the 2022 Census is the Fifth Rwanda Population and Housing Census (RPHC5) in series.

Since 2000, and following the endorsement of recommendations from major international conferences held under the auspices of the United Nations, the Government of Rwanda (GoR) has been focusing on the long-term Vision 2020 that aims at transforming Rwanda into a middle-income country. Rwanda pursued the Millennium Development Goals (2000-2015) on the international scene and currently seeks to achieve the Sustainable Development Goals (SDGs) as well as Rwanda's Vision 2050. These goals have been implemented through the medium-term planning framework of the Economic Development

and Poverty Reduction Strategy (EDPRS) and the National Strategy for Transformation (NST1). The measurement of progress in implementing national and international programmes in line with various AU and UN recommendations calls for availability of updated demographic and socio-economic statistical data to inform selected indicators at different levels.

The RPHC5 is a reliable and comprehensive source of such data. It was implemented in a way that allows the disaggregation of indicators at the lowest geographical level where it is applicable. The RPHC5 was undertaken to update the national mapping and demographic databases, to provide indicators for monitoring poverty reduction strategies and achievement of national, regional, and international development goals (NST1, Vision 2050, AU Agenda 2063, SDGs, etc.) and to strengthen the technical capacity of the National Institute of Statistics of Rwanda (NISR).

1.2. Legal and institutional frameworks

As an essential precondition for Census execution, the legislation of its operations was secured by the law No. 53bis/2013 of 28/06/2013 establishing the National Institute of Statistics of Rwanda and determining its mission, organization and functioning; and law No. 45/2013 of 16/06/2013 on the organization of statistical activities in Rwanda.

In order to ensure focused functioning during the whole period of Census execution, a Census Unit of NISR coordinated the overall implementation of the 2022 RPHC5 with support from other NISR units.

1.3. Objectives of the Census

The overall goal of the Fifth Rwanda Population and Housing Census (PHC5) is to contribute to the improvement of the quality of life of the Rwanda population by furnishing the Government and other stakeholders with relevant, reliable, and timely data and information for development planning, policy formulation and service delivery as well as for monitoring and evaluation of development programmes.

Specifically, the 2022 Rwanda Population and Housing Census has been implemented and is well placed to:

- Have increased availability and accessibility of accurate, timely and reliable data on demographic and socio-economic characteristics for evidence-based decisions, policy formulation and monitoring and evaluation of development frameworks at national, sub-national and sectoral levels;
- Have increased knowledge of stakeholders, at all levels, on population characteristics, patterns and trends;
- Have strengthened national capacities in data collection, processing, analysis, dissemination

- and utilization, including geographic information system (GIS).
- Have increased utilization, at all levels, of data and information for designing, monitoring and evaluating development programmes;

1.4. Census phases and Methodology

1.4.1. Census phases

Following the preparatory phase of the Census, which consisted of the production of the project document detailing all activities, schedule and Census budget, the following technical activities were undertaken:

- Census mapping conducted between 18th October, 2020 to 15th July, 2021;
- A Pilot Census conducted between 16-30 September, 2021;
- Questionnaire and manual development;
- Census publicity and sensitization campaign;
- Recruitment and training of field staff;
- Census enumeration conducted between 16 -30 August, 2022;

- Post Enumeration Survey conducted between 16-30 September, 2022; and
- Post-census activities, including analysis and dissemination of census results.

The success of the RPHC5 is widely attributable to the rigorous pre-census planning and robust census enumeration monitoring undertaken by the NISR as well as the remarkable support received from the Government, people of Rwanda and the generous technical and financial assistance from international development partners.

1.4.2. Census methodology

1.4.2.1. Census mapping

Census mapping was a crucial phase of the 2022 RPHC. The purpose of the census mapping is to divide the whole country into well-delineated enumeration areas that constitute the smallest operational census units to be assigned to each enumerator during the enumeration period.

The mapping used the latest versions of technology including satellite imagery and ArcGIS software to collect and document detailed information about the administrative units of the country, including boundaries, and locations of major social GPS coordinates of housing units and economic infrastructure (schools, health centres, hospitals, markets, administrative offices, etc.). These activities were carried out together with the estimation of the population and were used for delimitation of enumeration areas (EAs) in all villages (Imidugudu) of the country.

The Census mapping operation lasted for about 9 months (from 18th October, 2020 to 15th July, 2021), which enabled the NISR to better estimate the number of staff to be recruited (e.g., enumerators, team leaders, supervisors, etc.) and all logistics for

the main field data collection. Details from the Census mapping also provided guidance for adequate planning of the other census infrastructures and facilities required for field activities.

The outcomes of the Census mapping included the production of a new sampling frame for future surveys and an updated administrative area boundary map for Rwanda. In total, the country was delineated into 24,339 enumeration areas within the current boundaries of administrative units, consisting of five provinces, 30 districts, 416 sectors and 2,148 cells and 14, 436 villages. This allows for easy compilation of census results in these administrative entities.

1.4.2.2. Pilot Census

Prior to the RPHC5, a pilot census was designed for testing the census questionnaires, other census data-collection tools, enumeration time requirements and the state-of-preparedness of the entire field work organisation of the census.

The pilot census was conducted from 16th to 30th September, 2021 on a sample of 600 EAs, including

416 randomly selected EAs across all sectors and 184 purposively selected EAs in the areas bordering neighbouring countries to Rwanda and in remote rural areas in order to test the internet connectivity, data transmission, and the availability of electricity. The pilot census was initially planned for 16th to 30th August, 2021 just to fall one year before the main census but was postponed for one month to ensure adequate preventive measures against the spread of Covid-19.

The pilot census was a rehearsal for the actual census enumeration during which the various methods and procedures for field organisation and operations as well as the census publicity/awareness campaign, census maps production, field remote monitoring, data transmission and storage, ICT infrastructure, and data analysis were tested.

The lessons learnt from the pilot census exercise were used to revise some census procedures and instruments to ensure a smooth/successful implementation of the actual census enumeration.

1.4.2.3. Questionnaires and manuals

The questionnaires' design for the 2022 RPHC consisted of updating the questionnaires used during the 2012 census coupled with consultations with stakeholders such as planners and policymakers from different sectors, ministries, other government institutions, private sector, and government's stakeholders,... in order to collect their needs in terms of statistical data. After the development of the questionnaires and the instruction manual, the team of analysts developed a questionnaire specifications to support and ensure a smooth translation of the paper based questionnaire into the CAPI questionnaire by the IT and data processing team.

The lessons learnt during the pilot census were used by the NISR to improve and finalise the census questionnaires, containing 131 variables, as well as to revise the manuals of instructions for all the census functionaries.

The questionnaires used for data collection are presented in Annex of this report. Two different types of questionnaires were administered: one for private households and one for institutional households. The questionnaire for private households contained a person record, a household record and a mortality

record. The questionnaire for institutional households contained only a person record with few questions.

1.4.2.4. Census publicity and sensitisation campaign

The success of the census is dependent upon the cooperation and participation of the entire populace. It therefore, becomes imperative to sensitize and educate the public on the importance of the census, an objective that was achieved through the implementation of the communication strategy developed for the census. A phased approach was assumed in implementing the communication strategy that includes awareness in different ways and dissemination mechanisms.

Some of the methods used for publicizing the 2022 RPHC are as below:

- a. Digital Communication Programme through websites, social media, and mobile platforms;
- b. Public Relations, events and mass communication;
- c. Traditional Advertising through mass and outdoor media;
- d. Community Mobilization (Umuganda).
- e. Radios/TVs shows communication on the census calling for the public participation.

Prior to census enumeration, a national publicity and sensitisation campaign was implemented in order to inform the public about the importance and relevance of the census (RPHC5), as well as to seek the active participation, involvement and collaboration of administrative authorities during the census enumeration.

A subtle and targeted publicity and awareness campaign was conducted before the census, which was later intensified and expanded to cover all districts and villages across.

NISR was responsible for organizing and coordinating, as well as preparing and implementing appropriate communication strategies to all communities at both national and district levels. The materials were appropriately packaged and delivered to the districts for the implementation of communication activities. In addition, the NISR coordinated and implemented communication

interventions as guided by the communication strategy, and where necessary, by the prevailing conditions at the district level. Census's tasks force at Province and District levels played an important role in the census public awareness.

The census results published including the population projections attest to the high level of cooperation of the political and administrative authorities and the effective participation of the general public in the entire census enumeration operation and processes.

1.4.2.5. Recruitment and training of field staff

The RPHC5 was conducted by personnel from various institutions: the NISR (the census executing agency), the Rwanda Defence Force through involvement of the Ministry of Defence, the Ministry of Emergency Management, the Rwanda National Police, the Rwanda Correctional Services and MINEDUC (Sector Inspectors of education and teachers).

The recruitment of Census functionaries was done by each institution according to the needs (i.e., number and categories of staff needed) of the NISR, except in the case of teachers whose recruitment was done by the NISR in collaboration with administrative authorities at the district and sector levels.

At each stage of census implementation, the necessary induction and mandatory training of NISR staff and census personnel took place. For example, the census mapping phase was preceded by the training of cartographers, while the pilot census and the actual census enumeration were preceded by the training of enumerators, data quality monitors and their supervisors.

About twelve weeks prior to the commencement of actual Census enumeration, cascaded trainings were organised for all categories of census functionaries, namely:

- a. Core training for 59 people (exclusively NISR staff);
- b. Master training for 200 master trainers (NISR staff expanded to the Data quality monitors/team leaders and special institutions national coordinators;
- c. Training of trainers for 1,748 trainers organised in 30 training centres, one centre per district; and

- d. Training of 26,536 enumerators in 445 training centres spread across all sectors of the country.

The census training sessions focused on understanding of census questionnaire content, census enumeration processes and the correct completion of census questionnaires, reading and interpretation of census maps, practical role plays, and field practice. All the trainers and trainees were subjected to mandatory qualifying tests which they had to pass before being appointed.

In order to mitigate the risk of declining quality of training at the various cascading trainings, the training content was recorded in audio-visual materials from the studio. The recorded materials were projected in each training centre and were registered in each trainee's telephone for use in case of electricity outage or at home.

Regarding the organization of the training in each centre, four trainers were in charge of the training centre.

The training in each of the centres were coordinated at the central level by NISR trainers who moderated all training sessions using CISCO Webex to ensure that all contents were covered and timely management of the sessions.

1.4.2.6. Actual census enumeration

As planned, the actual census enumeration of the population in private and institutional households was conducted across the country from 16th to 30th August 2022, immediately after the Census reference night (the night of 15th to 16th August, 2022). Although data-collection activities were carried out by well-trained enumerators, quality assurance of the Census enumeration was ensured through close supervision at various levels.

The census personnel deployed for the RPHC5 comprised the following personnel:

- a. Enumerators and support staff;
- b. Sector supervisors;
- c. Field monitors/data quality monitors and district team leaders;
- d. Field analysts, data analysts; and
- e. National coordinators.

In accordance with the instructions contained in the census manual, each personnel ensured the operations of daily census activities within their area of supervision. Enumerators were accountable for the work done on a daily basis to their sector supervisors, who monitored the progress using dashboards and field visits facilitated by two motorcycles hired to facilitate the transport of Sector Supervisors in their daily supervisory activities.

As the dashboard was accessible to all supervisors at different levels of supervision, each supervisor was expected to understand what was going on regarding the data collection and then provide explanations for any identified issues.

A team of 60 data monitors was working at NISR headquarters coordinated by 10 field analysts. They were responsible of the follow up on the progress of data collection through the dashboards in all enumeration areas. They interacted with sector supervisors on a daily basis by identifying the enumeration areas with low completion rates, and then suggesting possible solutions including redeployment of those who completed enumeration in EAs lagging behind. They were also reporting any issue that needed special attention of the coordination team.

The dashboards allowed coordination team to continually monitor the progress of census enumeration in all the 24,399 enumeration areas but also ensuring for quality of the census. The use of dashboards allowed the identification of the enumeration areas with risk of not completing the enumeration on time and where additional resources and support were needed (e.g. enumerators, means of transportation to ensure the completeness).

1.4.2.7. Post-enumeration activities

The post-enumeration activities include the Post-Enumeration Survey (PES), data processing, release of results, thematic analysis, and dissemination of census results. The use of technology at all stages of the census enabled the rapid and timely publication of the main indicators report, as well as the tabulations and summary results contained in the thematic reports and other census products.

The PES was conducted from 16th to 30th September 2022, just in one month after the main census enumeration. The aim of the PES was to assess the census coverage/completeness and quality of the census data.

A total of 180 enumeration areas were sampled from all districts of the country. To assess census coverage, PES and census records were matched, a task that was carried out using data science techniques and the Python programming language. Matching is the process of checking whether records from two different data sets relate to the same household and/or person match or not. In this work, both automatic and clerical matching methods were used.

The census dataset –stabilisation, data-processing, and data-editing processes were completed within two months, after which census data tables for all thematic reports were generated.

The final results were subjected to an in-depth analysis across 18 generic themes (one of which is presented in this report) in accordance with the analysis plan developed for each theme. Census monographs for each of the 30 districts will also be produced.

1.4.2.8. Data quality assessment

An independent quality review (available as an internal report to NISR) was conducted in parallel with the thematic analysis. This investigated the work done prior, during, and after the census enumeration to maximise the level of data quality. The assessment confirmed strong planning and quality assurance throughout the enumeration. Assessment of the key demographic and socio-economic variables also confirmed the good quality of the RPHC5 data in terms of representation of the population.

The overall conclusion of the assessment is that the RPHC5 was implemented with strong quality controls and gives an excellent representation of the population of Rwanda with generally good measurement of its structure, both in terms of spread and demographic and socio-economic characteristics. The high quality of the data with respect to coverage and representation is confirmed by the results of the Post-Enumeration Survey, which measured the net coverage of the household population in the RPHC5 to be around 99% nationally.

with little variation across regions and by age and sex. Gross under-coverage was around 1.8% while gross over-coverage (erroneous inclusions) was around 0.2%.

The conclusion of excellent representation is also consistent with the plausible growth rate for the population over the intercensal period implied by the national results.

Some quality issues were identified on a few population characteristics. These include age heaping, particularly for ages with terminal digits 0 and 5. However, summary measures from Whipple's index, Myers' index and the UN joint score indicate comparatively some improvement and a reduction in

age heaping in the 2022 Census compared to the 2012 Census. There is also some evidence of under-reporting of infant deaths, and across other ages - hence the use of indirect methods is recommended for estimating mortality indicators.

In conclusion, there were no major quality issues identified in the 2022 Rwanda Population and Housing Census, except for some economic activity variables with low-quality reporting. The evaluation of key demographic and socio-economic variables as well as the triangulation of the data with other sources generally confirm the excellent quality of the RPHC5. Thus, the final database of the 2022 Rwanda Population and Housing Census is of high quality.

CHAPTER 2: JUSTIFICATION AND OBJECTIVES OF THE POPULATION PROJECTIONS

2.1. Context

Since the 1994 genocide against Tutsi, Rwanda has made considerable progress in restoring peace and political stability, human development and social and economic transformation. The development landscape has changed considerably since the adoption of the Vision 2020. The enabling factors for this social development are wide ranging including: strong political commitment, peace and stability, good governance, accountability, promotion of home grown solutions, effective decentralisation policies along with social reforms and programme interventions but also evidence based decision making.

The establishment of new villages in rural areas (Umuudugudu) through resettlement programmes, universal health insurance scheme (Mutuelle de santé), decentralization of health facilities at lowest administrative levels and Economic Development and Poverty Reduction Strategy (EDPRS) are examples of successful social and health care interventions in Rwanda (Ministry of Finance and Economic Planning, 2013; May and Kamurase, 2009). Despite these achievements, Rwanda's future has been threatened by a high rate of population growth, which in turn has a negative consequence on physical and natural resources. In fact, Rwanda is one of the countries in Africa with a high population density (PRB, 2022), where excessive population growth puts severe pressure on land, settlements and living conditions (NISR, 2007).

For a long time, the country has tried to integrate population issues into development programmes

through various efforts including the redistribution of population and land, and has been successful with direct interventions in reducing the growth rate through effective family planning and health care programmes (Ministry of Finance and Economic Planning, 2013; NISR, MoH and ICF International, 2012; Singh et al. 2012; ONAPO, 1990).

For the last two decades, the country has been implementing multidimensional population policies that include several features such as land management, improving health conditions of the population, universal access to health care including reproductive health and family planning services, and interventions aimed at improving the levels of education for both girls and boys. In 2020, the government launched the Vision 2050 programme with the aim to transform Rwanda into an upper-middle income country with a target of reaching GDP per capita of over 4,036 USD by 2035 and 12,476 USD by 2050.

It is in this context where past, current and future population data become critically important in allocating resources for planning, implementation, monitoring and evaluation of all development programmes. More precisely, in order to support national, regional and local planning, the country needs to generate timely and reliable data to monitor demographic, social and economic changes, assess the impact of past interventions and integrate population variables in future interventions and planning.

2.2. Justification for Population Projections

The Fifth Rwanda Population and Housing Census was conducted from 16th to 30th August 2022, ten years after the previous one (2012) as recommended by the United Nations (UN, 2017) in order to provide to the Rwandan Government, its development partners and all decentralized structures with reliable and up-to-date data disaggregated down to the lowest geographical level needed for an accurate

description of the demographic and socio-economic characteristics of the population.

Population projections are inevitable tools for decision makers and planners.

Government ministries representing virtually all sectors, particularly health, education, transport, environment, social welfare and housing, constantly

seek population projections of future demographic parameters for planning purposes in general, but also for resources' allocation in particular.

Population projections provide information not only on the future total population, but also on population disaggregated by age and sex for specific sub-groups of the population such as school-age, working-age, the elderly, females in the reproductive ages as well as the expected number of births and deaths, the number of new households to be created, and other relevant estimates for designing various interventions aimed at improving the living conditions of the future population.

Population projections provide critical information on the future population size as well as age-sex structure based on a set of assumptions about future changes in fertility, mortality and migration. They yield key population indicators needed for future planning, implementation, monitoring and evaluation of various social, economic and developmental policies and programmes of a country. This is especially the case for the measurement of the progress made by Rwanda in implementing the first National Strategy for Transformation (NST1), progress towards the achievement of the Sustainable Development Goals (SDGs) and the goals of the Programme of Action of the 1994 Cairo International Conference on Population and Development (UNDP, 2008; NISR, 2007).

The progress made in the achievement of these indicators reflected in recent national level data from large-scale surveys such as the Demographic and Health Surveys (DHSs), Integrated Household Living Conditions Surveys (EICVs) and other data sources are crucial and should be integrated in building realistic assumptions regarding future levels of fertility and mortality (Binagwaho et al., 2013).

The future population size and age-sex structure are determined by changes in fertility, mortality and migration. This implies that, in order to determine the size and structure of the future population, projections should consider cohorts defined by age and sex and make realistic assumptions regarding the future course of fertility, mortality and migration (O'Neill et al., 2001). It is important to determine the base year and duration of the projections, analyse the past trends of fertility, mortality and migration

based on previous censuses and surveys and develop possible scenarios based on the assumptions regarding future changes in demographic events (births, deaths and migration).

Population projections shed light on the interactions of various demographic variables and their impact on the future evolution of some parameters such as the size, composition and distribution of the population, and the related demographic events (births, deaths, marriages and migration). The projected population by age and sex directly feed into development planning; for example, determining the number of nurses to be trained, the number of classrooms to be built, the number and type of public facilities and infrastructure needed for new settlements in urban areas, and so on.

For effective advocacy, population projections are indispensable, especially where there is a potential negative impact of a particular developmental phenomenon on population or vice versa. This includes, for instance, policies to harness a demographic dividend, and the need to develop effective policies that foster education and economic opportunities for the growing number of women and young people, or the need to adopt social sector spending to the changing age structure and providing social support and health care for the elderly population.

Commonly, researchers use population projections with the purpose to answer questions that relate to future social and economic development. They may study, for instance, the future growth of the working-age population and the challenges for generating sustainable employment and livelihood opportunities in both urban and rural areas.

However, population change can equally be regarded as being, to some extent, a dependent rather than independent variable in the planning process. As such, population projections would be used to estimate the likely impact of policy changes and planning decisions on demographic trends. This includes, for instance, the estimation of the impact of improved family planning and health services on fertility and mortality rates at the national and sub-national levels.

Population projections become an important input in programmes not only during target setting, but also for monitoring and evaluation, especially at impact level.

They are useful in assessing whether Rwanda is on track in achieving national and international targets such as the SDGs to which it has committed itself to achieving.

Most of programme indicators in monitoring progress need population figures as denominators.

Population projections are also a critical input in driving production and consumption within the private sector. Roping in the private sector in the utilization of population projections is a crucial entry

point in soliciting for their support in the generation of accurate and timely data from future censuses.

The 2022 Rwanda population projections were done for 30 years ahead (2022-2052) in order to inform the Rwanda Vision 2050 and will be adjusted upon implementation of the 2032 and 2042 Rwanda population and Housing Censuses.

The urban population was projected based on the country's aspiration to have 70% of the population in urban areas by 2050 (vision 2050).

2.3. Objectives of the population projections

2.3.1. Overall Objective

The overall objective of the population projections is to provide to decision-makers, planners and development partners with reliable information on the various components of the projected Rwanda population between 2022 and 2052.

2.3.2. Specific Objectives

More specifically, the objectives of the report are to present and interpret the future trends of:

- The size of the total population, its age-sex structure and density;
- The size of the urban and rural populations, their age-sex structures and densities;
- Fertility and mortality indicators;
- The sizes of specific interventions target groups; and
- The number and mean size of private households along with the annual number of new households to be created.

2.4. Definitions of concepts and key indicators

Age-dependency ratio: defined internationally as the ratio of persons in dependent ages (under 15 and 60+ years) to economically productive ages (15-59 years); in the Rwandan context under 16 and over 64 years as dependent, and 16-64 years as economically productive.

Age-sex structure: is the distribution of the population by age and sex.

Age-specific fertility rates (ASFRs): are obtained by dividing the number of births to women in a particular age group, in a specific calendar year, to the mid-year population of women in the same age-group. The ASFR of a given age group in a given year measures the average number of children a woman of that age group would have under the current fertility conditions of that year and assuming that she

is expected to survive throughout the reproductive ages.

Average household size: is obtained by dividing the total population living in private households by the total number of private households.

Childbearing age: is generally defined for women as the age interval 15-49 years during which they give birth. It is also referred to as reproductive ages.

Children: are officially defined in Rwanda as persons aged 0-17.

Crude birth rate (CBR): is defined as the total number of live births per 1,000 inhabitants in a given year. It measures the frequency of births within a population.

Crude death rate (CDR): is defined as the total number of deaths per 1,000 inhabitants in a given year.

Doubling time: is the time that a population takes to double its current size calculated based on a given growth rate.

Elderly: is defined by the United Nations as people aged 60 years and above (United Nations, 2007). It is the same age used in the analysis of the 2002 Census. However, in Rwanda the normal retirement age is now 65 years old and the early retirement age is 60 years instead of 55 years.

Fertility: is the number of children born to a woman. It refers to the actual reproductive performance of a woman.

General Fertility Rate (GFR): measures the number of births in a given year divided by the corresponding mid-year population of women in the childbearing years (15-49). It is a refined measure when compared to CBR which includes total population at risk in the denominator.

Private Household: is defined as a household with a single person or a group of people living together voluntarily, having common housekeeping arrangements for supplying basic living needs, such as principal meals; the group may consist of related or unrelated persons.

Infant mortality rate (IMR): is the probability of dying before the first year of life in a specific year, usually expressed in terms of deaths per 1000 live births.

Life expectancy at birth (LEB): is a hypothetical measure that estimates the average number of years that a new-born could expect to live if he/she had to live all his/her life under the current mortality conditions. Life expectancy can also be calculated at any given age as the number of years a person of that age would expect to live under the current mortality conditions.

Mean age at childbearing: is defined as the average age of mothers at the birth of their children if women were subject to the age-specific fertility rates observed throughout their childbearing years in a given year.

Migration: is defined as the movement of people across a specified boundary for the purpose of establishing a new residence.

Mortality: is defined as the number of deaths that occur in a population.

Net migration rate: is defined as the net effect of immigration and emigration in a given population, expressed as either increase or decrease per 1,000 inhabitants in a given year. It is calculated by dividing the difference between the number of in-migrants and the number of out-migrants by the resident mid-year population multiplied by 1,000.

Population census: a total count of members of a population usually every 5 or 10 years. In Rwanda, the census is conducted every 10 years.

Population density: is defined as the number of persons per square kilometre.

Population dynamics: changes in a population over time due to changes in fertility, mortality and migration.

Population projections: are scenarios of what future populations might look like under given assumptions.

Population growth rate: is the rate at which a population grows (increase or decrease) during a given year as a result of natural increase plus net migration; expressed as a percentage of the base population.

School-age population: depends on the education system in a country. In Rwanda, the school-age population is defined as the population aged 3-18 years; classified by pre-school (3-6 years), primary (7-12 years), and secondary (13-18 years).

Sex ratio: is defined as the number of males per 100 females in a population. It is calculated by simply dividing the total number of males in the population by the total number of women multiplied by 100.

Total fertility rate (TFR): it is an hypothetical measure that estimates the average number of children a woman would have at the end of her reproductive age if she were subject to a pre-determined age-specific fertility rates (ASFRs) of a

given period. It is calculated by summing the ASFRs and multiplying the sum by the width of the age interval.

Working-age population: is generally defined as population aged 15-64, but in the Rwandan context, the definition is the age interval 16-64 years.

Youth: is officially defined as people aged 14-35 years in Rwanda.

CHAPTER 3: OVERVIEW OF THE NATIONAL DEMOGRAPHIC CONTEXT

3.1. Source of data

Since the last census in 2012, Rwanda has conducted a number of data collection exercises that provide representative information on the levels and trends of key indicators on the population including size, age-sex structure and the driven factors of its dynamics. These include the Demographic and Health Surveys (DHSs) conducted in 2014/2015 and 2019/2020, and the recent population and housing census conducted in 2022.

The DHSs highlight the demographic changes Rwanda has experienced in recent years especially with

regard to fertility and childhood mortality, while the data from the last census provides information on the size, structure and spatial distribution of the total, urban and rural population but also some key demographic aspects of the Rwanda population.

The population projections presented in this report used data from these sources to estimate the size, composition and dynamics of the population in the next thirty years (2022-2052).

3.2. Quality of data

Census enumerations are usually not perfect: reported data on the population may be affected by several factors. The total population may be under- or over-reported for whatever reasons. Furthermore, the age and sex structure may be affected by age misreporting, by under- or over- enumeration of people of certain ages, and in some cases by duplications of people of certain ages. Before using the census counts as the base for projection, they must be evaluated for errors and adjusted when necessary (UN, 2017a).

Indeed for the RPHC5, an evaluation for both coverage and content errors was undertaken. As detailed in Theme one (1) on Data Quality, an evaluation on coverage errors concluded that the RPHC5 has a high overall coverage and of good quality. However, an evaluation on content errors

shows some evidence of very limited age heaping, particularly on terminal digits 0, 5 and on a few even numbers like 2. There were some irregularities in age reporting in 2022, although a comparison of the observed patterns of age-sex reporting in 2022 with the two previous censuses (2002 and 2012) signifies an improvement in the accuracy and quality of age-sex data.

In conclusion, heaping on the preferred terminal digits does not potentially create any problem particularly when grouped age structure is used, and the age-sex structure in RPHC5 is sufficiently well-reported to be used for projections. Consequently, there was lack of evidence to warrant any adjustment of neither the population size nor the age-sex structure based on the evaluation of coverage and content errors

3.3. Size and age-sex structure of the population

The final results of the 5th Population and Housing Census of Rwanda give a total resident population of 13,246,394 people as of August 15th 2022, "census night". The population sex ratio is 94.3 males per 100 females, indicating a higher representation of females (6,817,068) than males (6,429,326). The resident population recorded in the 2022 census added 2,730,421 more people when compared to the 2012 census, yielding an intercensal average annual growth rate of 2.3%. This rate is greater than that of

1991-2002 (1.2%) but less than that of 2002-2012 (2.6%).

Evidently, Rwanda recorded an unprecedented low intercensal annual growth rate of 1.2% between 1991 and 2002 due to the 1994 genocide. The reversal of annual growth rates to 2.6% between 2002 and 2012, and then 2.3% between 2012 and 2022 clearly indicates that Rwanda continues to make a gradual recovery in terms of population lost due to the

genocide but also improvement in population wellbeing.

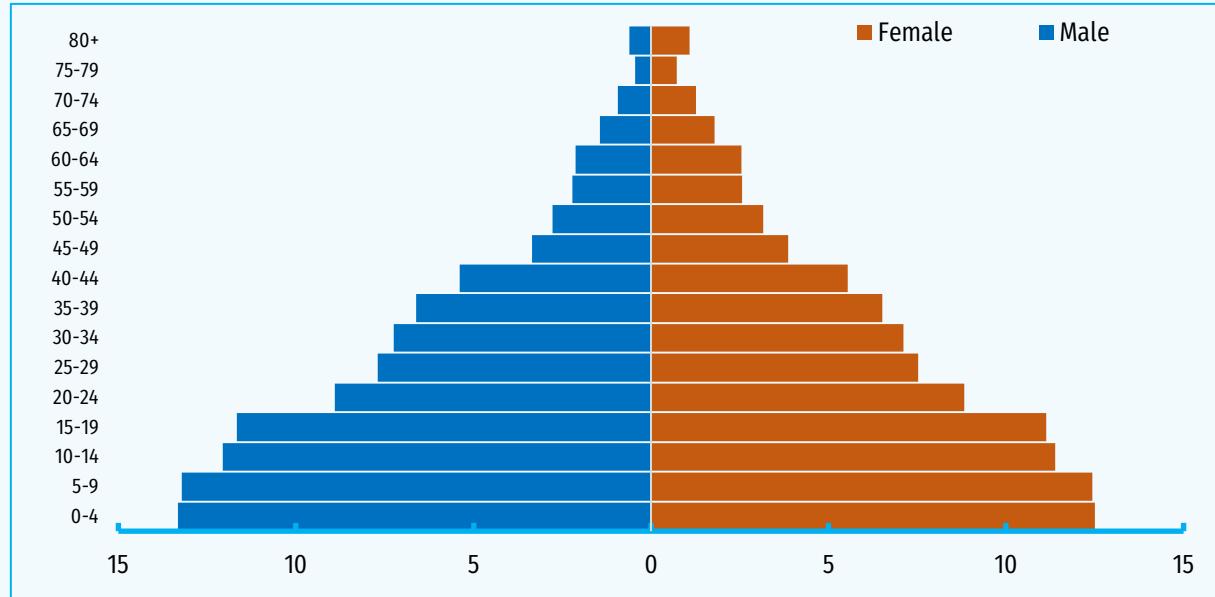

The sex ratios show a deficit of males although this imbalance is declining over the census years (i.e. from 91 males per 100 females in 2002 to 93 in 2012, and then 94 in 2022), especially at young ages (Figure 3.1).

A review of the age-sex structure of the population in 2022 highlights the following key findings:

- An expanded base of the age pyramid, characteristic of population with recent high fertility;

- A tapered top of the pyramid, a pointer to high adult mortality in the past;
- A predominantly young population: those under-20 years represent 49% of the total population;
- The proportion of potentially economically active population (16-64 years) is 56% of the total population; and
- The proportion of the elderly (60 years and above) is 6.5% of the total population.

Figure 3. 1. Age pyramid of the resident population of Rwanda, 2022

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

3.4. Population dynamics indicators

The three components that drive the dynamics of a population are fertility, mortality and migration. This section reviews the various indicators within these three components.

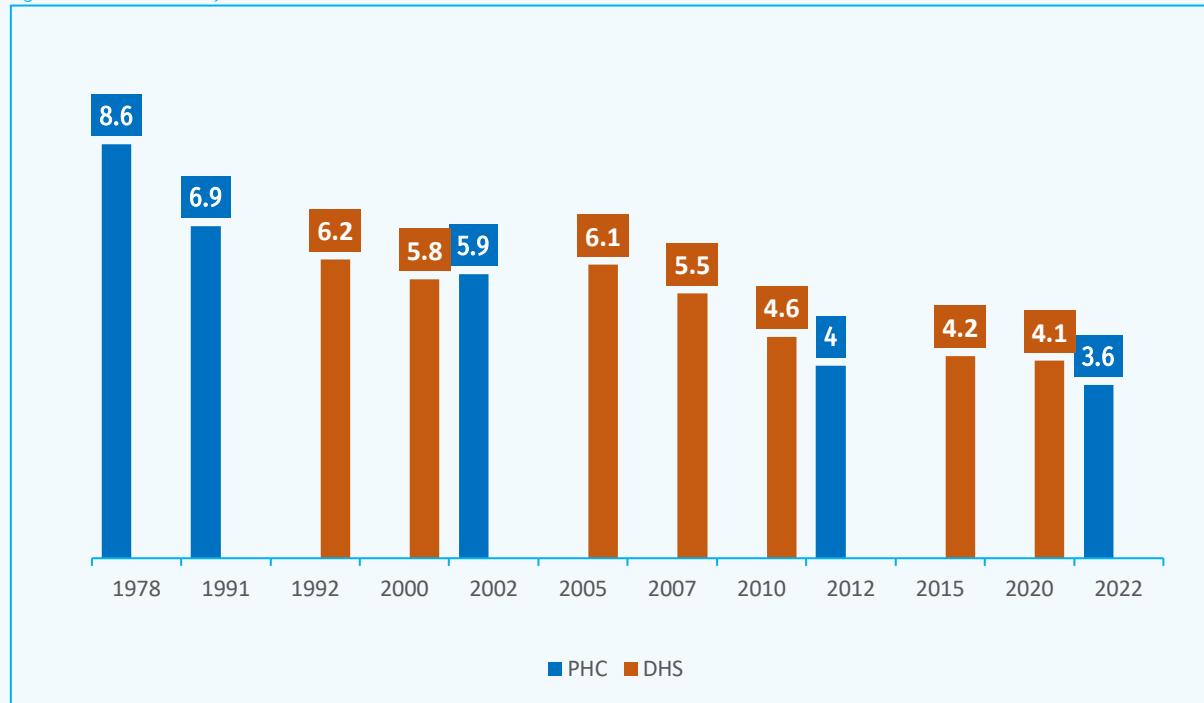

3.4.1. Fertility levels and trends

Of the three components, fertility usually has the greatest influence on population dynamics. Indeed, fertility continues to exert considerable impact on natural increase in the population of Rwanda. Fertility can be measured using several indicators such as the Crude Birth Rate (CBR), Total Fertility Rate (TFR) and Age-Specific Fertility Rate (ASFR). According to the RPHC5, the TFR is 3.6 children per woman in

2022, slightly more than twice lower than the 8.6 recorded in 1978 by the first PHC.

According to the censuses and surveys conducted in Rwanda, the total fertility rate (TFR) has increased by 5% from 5.8 children per woman in 2000 to 6.1 in 2005, before decreasing by 34% to 4.0 children per woman in 2012, and by a further 10% to 3.6 children per woman in 2022 (Table 3.1 and Figure 3.2).

Figure 3.2. Evolution of the TFR between 1978-2022

ASFR = Age-Specific Fertility Rate; TFR = Total Fertility Rate; GFR = General Fertility Rate; CBR = Crude Birth Rate

Sources: Rwanda 1978, 1991, 2002, 2012 and 2022 PHCs and Rwanda 1992, 2000, 2005, 2007, 2010, 2014-15 and 2019-20 DHSs

The significant decline of fertility may be explained partly by the increase in modern contraceptive use as shown by the increase in Contraceptive Prevalence Rate (CPR) from 10% in 2005 to 45% in 2010, then to 48% in 2015 (2014-15 DHS), and then to 58% in 2020 (2019-20 DHS) [Figure 3.3].

Another contributory factor is the observed increase in net attendance rate in secondary school for girls that increased from 10% in 2005 to 21% in 2012 (EICV 2010-11), and then to 39% in 2020 (2019-20 DHS). More generally, the fertility decline resulted from the government policy of raising public awareness down to the village level for the adoption of responsible parenthood behaviours and ensuring availability of community health services at the lowest geographical level.

Figure 3.3. Trend in contraceptive prevalence

3.4.2. Mortality levels and trends

Mortality is a key component of population change and has influence across all ages. The pattern of mortality by age usually assumes a near "U"-shape - suggesting high concentration of deaths in the very early and older ages. It is measured by a number of indicators including crude death rate (CDR), life expectancy at birth (LEB), infant mortality rate (IMR) and under-five mortality rate (U5MR). Life expectancy at birth is the best summary indicator to measure the level of mortality, health status and wellbeing of the population.

As presented in Table 3.2, life expectancy at birth (e0) in Rwanda was 46.4 years in 1978, it increased to 53.7

years in 1991, before decreasing to 51.2 years in 2002. Thereafter, it has recorded increases: from 51.2 years to 64.5 years (about 26%) between 2002 and 2012; and from 64.5 years to 69.7 years (about 8%) between 2012 and 2022. The decline in mortality is further reflected in the substantial reduction in IMR: from 144 per 1000 live births in 1978 to about 49 in 2012, and then to 29 in 2022 (Figure 3.4). The under-five mortality has followed the same pattern of decline. The changes in IMR between 1992 and 2002 were trivial, which is explained by the influence of the 1994 genocide. Most of the decline in mortality actually took place during the last two decades.

Figure 3.4. Trend in childhood mortality rates

The increase in life expectancy at birth (Figure 3.5) is due to the improvement of the health status of the population, especially during the last two decades following several vigorous social and health care interventions aimed at reducing the leading causes of

death through: improved capacity (in both health personnel and infrastructures); improvement in the public hygiene systems and universal access to health insurance by the population.

Figure 3.5. Trend in life expectancy at birth (1978-2022)

Sources: Rwanda 1978, 1991, 2002, 2012 and 2022 PHCs

3.4.3. Migration levels and trends

The pattern of migration in Rwanda varies according to the type of migration, internal versus international. Regarding internal migration, majority of the population of Rwanda remains in their place of origin, since only 20% of the resident population were reported to reside in a district other than their district of birth (lifetime migrants), and 10% were reported having resided in a district different from their current district of residence (recent migrants) in the last five years preceding the census date. The percentage is even lower if one considers the change of residence at the province rather than the district level.

The analysis of the origin and destination of migrants (migration flows) shows evidence that most migrants who changed their residence between provinces tend to move to neighbouring provinces. Conversely, provinces receive migrants from neighbouring

provinces or countries. The City of Kigali and Eastern Province received more migrants than other provinces of the country, regardless of the type of migration considered.

As for international migration, the stock is negligible as compared to the size of the whole population. Although there have been significant cross-border migration in Rwanda in the 1990s triggered by the 1994 genocide against Tutsi, this unusual phenomenon is unlikely to reoccur in the future. According to the 2022 PHC data, the foreigners represented only 1% of the resident population of Rwanda. This clearly implies that international migration has negligible impact on population change in Rwanda and, therefore, the assumption of negligible net international migration was retained for the projections at national level in the Rwandan context.

CHAPTER 4: PROJECTION PARAMETERS, ASSUMPTIONS AND SCENARIOS

Population projections are based on how assumptions of the different parameters are specified. Given that population growth rate has implications on all sectors of national life, population projections should integrate a systematic analysis of past trends of demographic components and derive realistic assumptions of future trajectories. Rwanda, with an average annual growth rate of 2.3%, resembles other Sub-Saharan African countries where rapid population growth constitutes a serious threat on national development.

Indeed, at this rate of growth, the population of Rwanda is expected to double in 30 years reaching more than 26 millions by 2052. Given the relatively small surface area of Rwanda (just above 26 thousands square kilometres), this rapid population growth is expected to exert tremendous demographic pressure on available resources especially agricultural land in the future. The population density would be around 1000 per square kilometer. The population projections are generated over a period of 30 years - from 2022 to 2052 in single and 5-year age-groups.

4.1. Projection parameters

The projection parameters considered here are the distribution of the resident population by sex, age and area of residence, fertility and mortality and migration.

4.1.1. Total, urban and rural population

The base population is the 2022 mid-year (1st July 2022) population from the RPHC5 data disaggregated by sex, age and area of residence. It was obtained by retro-projecting the resident population enumerated by the RPHC5 that refers to 15th August 2022 using the 2012-2022 intercensal annual growth rate. Figure 4.1, Figure 4.2, and Figure 4.3 present the distribution of the base population by sex, age and area of residence (Total, Urban and Rural).

It has to be noted that the national population sex ratio of 94 males per 100 females is a reflection of the deficit of men in rural areas (92 males per 100 females) whereas that in urban areas is (101 males per 100 females). Further analysis shows that men in the adult ages are more represented in urban areas suggesting labour migration flows of men from rural to urban areas. On the other hand, there is a balance in sex ratio in the population aged 0-4 years (Table 4.1).

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

4.1.2. Fertility

Fertility indicators considered for the population projections are total fertility rate (TFR) and the age-specific fertility rates (ASFRs).

a) Trends in total fertility rate

The base value for the TFR is set at 3.6 children per woman derived from the RPHC5 thematic report on Fertility. The value of TFR has been dropping from 5.9 in 2002, to 4.0 in 2012.

b) Age-specific fertility rates

As for the age-specific fertility rates, the projections is expected to use the rates provided by the RPHC5. However, these are normalized so that the sum of the ASFRs are 100%. In other terms, what is used as input for the projections are the respective contributions of the 5-year age-groups to the total fertility as measured by the TFR, as shown in Table 4.2.

Table 4. 2. Age-Specific Fertility Rates and contribution to total fertility, 2022

Age-group	Age-Specific Fertility Rates	Contribution (%) to total fertility
15-19	25	3.4
20-24	137	18.8
25-29	176	24.2
30-34	165	22.7
35-39	134	18.4
40-44	75	10.3
45-49	15	2.1
Total	727	100

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

4.1.3. Mortality

The projection parameter for mortality is the life expectancy at birth over time.

a) Life expectancy at birth

The trend in mortality data shows that the annual change in life expectancy at birth during the period 1978-1991 was 0.45 years for males, 0.68 years for females and 0.56 years for both sexes. For the period 1991-2002, the annual decrease in life expectancy at birth was about 0.23 years for the entire population. However, there were gains in the succeeding intercensal periods such that between 2002 and 2012, the annual increase rate was 1.33 years and 0.52 years between 2012 and 2022 for both sexes as shown in Table 4.3.

Table 4.3. Trends in life expectancy at birth and annual growth rates, 1978-2022

Year/Period	Sex			Gap between Male and Female
	Both sexes	Male	Female	
Life expectancy at birth (e_0) in years				
1978	46.4	45.1	47.7	2.6
1991	53.7	51.0	56.5	5.5
2002	51.2	48.4	53.8	5.4
2012	64.5	62.6	66.2	3.6
2022	69.6	67.7	71.2	3.5
Annual change in years				
1978-1991	+0.56	+0.45	+0.68	
1991-2002	-0.23	-0.24	-0.25	
2002-2012	+1.33	+1.42	+1.24	
2012-2022	+0.51	+0.51	+0.50	

Sources: Rwanda 1978, 1991, 2002, 2012 and 2022 PHCs

b) Operational model for the decline of mortality

The estimation of life expectancy at birth within the projection period is based on the United Nations Population Division model schedule of changes in life expectancy (United Nations, 1982). This schedule assumes that life expectancy at birth, for both males and females, increases by 1.2 to 2.0 years over each five-year period when life expectancy is between 67.5-70.0 and then increases at a slower rate at higher levels.

Table 4.4 shows the working model used in the United Nations population projections. These assumptions are based on the principle that there are no external shocks such as war, national or global epidemics or other disasters and major economic crises. However some adjustments were made depending on the trajectories of childhood mortality and some other improvement in socio-economic conditions as it have been experienced in the last two decades.

Table 4.4. United Nations model of life expectancy improvement during a five-year period

Initial life expectancy	Rapid Rise		Moderate Rise		Slow Rise	
	Male	Female	Male	Female	Male	Female
55.0-57.5	2.5	2.5	2.5	2.5	2.0	2.0
57.5-60.0	2.5	2.5	2.5	2.5	2.0	2.0
60.0-62.5	2.5	2.5	2.3	2.5	2.0	2.0
62.5-65.0	2.3	2.5	2.0	2.5	2.0	2.0
65.0-67.5	2.0	2.5	1.5	2.3	1.5	2.0
67.5-70.0	1.5	2.3	1.2	2.0	1.0	1.5
70.0-72.5	1.2	2.0	1.0	1.5	0.8	1.2
72.5-75.0	1.0	1.5	0.8	1.2	0.5	1.0
75.0-77.5	0.8	1.2	0.5	1.0	0.3	0.8
77.5-80.0	0.8	1.0	0.4	0.8	0.3	0.5
80.0-82.5	0.5	0.8	0.4	0.5	0.3	0.3
82.5-85.0	-	0.5	-	0.4	-	0.3
85.0-87.5	-	0.5	-	0.4	-	0.3

Source: UN. 1982. Model Tables for Developing Countries

4.2. Projection assumptions

The assumptions for each component of population change are explained in the sub-sections below.

4.2.1. Fertility

This sub-section first examines the current situation of Rwanda in terms of policies and programs aimed at controlling fertility and then outlines the assumptions on future trends in fertility.

a) Policies and programmes on fertility in Rwanda

Based on empirical data, fertility change in Rwanda can be classified into three periods in line with the three phases of implementation of the national policies and programmes put in place to mitigate the rapid growth of the population.

These include:

- a period of steady decline in fertility (1978-1992) following a proactive government policy to reduce fertility by implementing a vigorous family planning programme using all available means;
- a period of increase in fertility (the 1994 genocide aftermath) - the 1994 genocide had a catastrophic impact on health systems and households were affected severely by loss of family members. Fertility declined slightly during this period but then picked up again between 2000 and 2005, recovery period.
- The post-2005 rapid decline in fertility was attributed to increase in access to community-

based health services, successful public campaigns promoting responsible parenthood and, more importantly, increased access to health facilities, a steady increase in the level of education of females; and

- a period of rapid decline in fertility (2005 to present).

b) Assumptions about future trends in fertility

The following assumptions were made based on an assessment of past and current trends in fertility:

1. **High fertility assumption:** TFR would decrease from 3.6 children per woman to 2.9 children per woman between 2022 and 2052, assuming that the revised target of Vision 2050 would be reached by the end of the projection period:
 - ✓ TFR = from 3.6 children per woman in 2022 to 2.9 children per woman in 2052.
2. **Medium fertility assumption:** TFR would decrease constantly from 3.6 children per woman in 2022 to about 2.6 children per woman in 2052 based on the recent changes in fertility observed between 2005 and 2022:

- ✓ TFR = from 3.6 children per woman in 2022 to 2.6 children in 2052.
- ✓ **Low fertility assumption:** TFR would decrease from 3.6 children per woman in 2022 to 2.3 children per woman in 2052. It is assumed that fertility is expected to continue to decline to reach its current

level among women with secondary and university level of educational attainment, which is about 2.3 children per woman by the end of the projections period, 2052: TFR = from 3.6 children per woman in 2022 to 2.3 children in 2052.

4.2.2. Mortality

a) Policies and programmes related to mortality in Rwanda

As mentioned above, the current socio-health context of Rwanda is characterized by: increased availability of health facilities down to the lowest administrative level; universal access to health care through mandatory medical insurance for all; and significant improvement in family and environmental hygiene. These factors contributed to the decline in mortality as clearly illustrated by the increase in life expectancy at birth – from 51.2 years for both sexes in 2002 to 64.5 years in 2012, and then to 69.6 years in 2022. It is assumed that these factors are expected to continue to play a significant role in improving the health and living conditions of people, along with the Vision 2050 agenda aimed at transforming Rwanda into an upper-middle income country.

b) Assumptions regarding future mortality trends

Based on the assessment of past mortality trends and recent dramatic improvements in human survival attributed to social and economic development, it is assumed that life expectancy at birth in Rwanda is expected to increase up to about 78 years by the end of the projection period.

Three assumptions were used:

- High mortality assumption: life expectancy at birth (LEB) would increase from 69.6 years 2022 to 75 years in 2052, according to the low rise of the UN model of mortality decline (United Nations, 2003):
 - ✓ LEB (Male): 67.7 years in 2022 to 73 years in 2052
 - ✓ LEB (Female): 71.2 years in 2022 to 77 years in 2052
- Medium mortality assumption: life expectancy at birth (LEB) would increase steadily from 69.6 years 2022 to 78 years in 2052, according to the moderate rise of the UN model of mortality decline (United Nations, 2003):
 - ✓ LEB (Male): 67.7 years in 2022 to 76 years in 2052
 - ✓ LEB (Female): 71.2 years in 2022 to 80 years in 2052
- Low mortality assumption: life expectancy at birth (LEB) would increase rapidly from 69.6 years 2022 to 81 years in 2052, according to the fast rise of the UN model of mortality decline (United Nations, 2003):
 - ✓ LEB (Male): from 67.7 years in 2022 to 79 years in 2052
 - ✓ LEB (Female): from 71.2 years in 2022 to 83 years in 2052.

4.2.3. International Migration

As argued in sub-section 3.4.3, the contribution of international migration to the Rwandan population growth would be negligible. Therefore, it was assumed that the net international migration is zero when projecting population at the national level throughout the projection period.

- ✓ Assumption: Net international migration is zero.

4.3. Projection scenarios

Based on the assumptions regarding fertility and mortality, three possible scenarios were derived to

project the Rwandan population from 2022 to 2052. These scenarios are:

- **High scenario** – where the TFR would decrease from 3.6 children per woman in 2022 to 2.9 at the end of the projection period, while the life expectancy at birth would increase from 67.7 years in 2022 for males and 71.2 years for females to 73 years for males and 77 years for females in 2052.
- **Medium scenario** – where the TFR would decrease from 3.6 children per woman in 2022 to 2.6 at the end of the projection period, while the life expectancy at birth would increase from 67.7 years in 2022 for males and 71.2 years for females to 79 years for males and 83 years for females in 2052.

67.7 years in 2022 for males and 71.2 years for females to 76 years for males and 80 years for females in 2052.

- **Low scenario** – where TFR would decrease from 3.6 children per woman in 2022 to 2.3 by the end of the projection period, while the life expectancy at birth would increase from 67.7 years in 2022 for males and 71.2 years for females to 79 years for males and 83 years for females in 2052.

4.4. Projection Methods

The data from the above-presented scenarios were used as inputs in the SPECTRUM software in its Demproj and Rapid modules (Stover and Kirmeyer, 2005) to generate the total and other indicators of the population of Rwanda for the next 30 years (2022-2052).

Different methods are used in projecting population depending on the type of projections: “global projections” or “sectoral projections”. “Global projections” refer to projections of the whole population while “sectoral projections” refer to projections of sub-group populations. For “**global projections**”, the method used is the so-called cohort-component method which takes into account the components of population change: fertility, mortality and migration.

This method follows a group of people of the same age (cohort) and sex throughout its lifetime, exposing it to assumed age- and sex-specific mortality, fertility and migration rates.

An initial or base year population, disaggregated by age and sex, is exposed to age-sex-specific chances of dying as determined by estimated and projected mortality levels and patterns. Once deaths are estimated, they are subtracted from the population figure at each age, yielding survivors in the subsequent time period.

Fertility rates are projected and applied to the female population of childbearing age to estimate the number of births every year. Each cohort of children born is also followed through time and survivors are calculated after exposure to appropriate mortality rates.

Finally, the method takes into account net migrants by adding them to, or subtracting them from, the population at each specific age. The whole procedure is repeated for each year of the projection period, resulting in the projected population by age and sex through 2052.

The logic of this method is explained by the following simple balance equation (1):

$$Pop(t2) = Pop(t1) + B(t1, t2) - D(t1, t2) + Immig(t1, t2) - Emig(t1, t2)$$

Where:

- $Pop(t1)$ is the size of the population at time $t1$ (initial population);
- $Pop(t2)$ is the size of the population at time $t2$;
- $B(t1, t2)$ is the number of births between $t1$ and $t2$;
- $D(t1, t2)$ is the number of deaths between $t1$ and $t2$;
- $Immig(t1, t2)$ is the number of immigrants between $t1$ and $t2$; and
- $Emig(t1, t2)$ is the number of emigrants between $t1$ and $t2$.

In the present case, net international migration is presumed to be zero, hence equation (1) is modified to be:

$$Pop(t2) = Pop(t1) + B(t1, t2) - D(t1, t2)$$

This equation was used to project the future size of the population of Rwanda in single years and 5-year age-groups from 2022 to 2052, by adding the number of annual births in 2022 to the base year population (2022) and subtracting the number of annual deaths at each age in the base year. The number of annual births is obtained by multiplying the ASFRs of 2022 to the female population at risk (those aged 15-49 years).

The number of births is further disaggregated by sex, by applying the sex ratio at birth (105 males per 100 females in this case). The surviving births are then calculated by applying the probability of surviving at ages between 0 and 1. The number of annual deaths is obtained by applying survival ratios calculated from the 2022 age-specific death rates (ASDRs) to the corresponding population at each age (age-group). The number of deaths is then disaggregated by sex. As for the ASDRs, life expectancy for each sex is obtained by applying an interpolation using the observed life expectancy in 2022 and the assumed projected life expectancies through 2052.

The projections of the urban population are obtained by applying the corresponding urbanization rate to

the total population for each year. The projected urbanization rates are obtained by interpolation using the observed urbanization rate in 2022 and the assumed urbanization rate of 70% by 2052 as stated in the vision 2050.

The size of specific intervention target groups at each projection year is obtained by extracting the corresponding population from the total population of the year using the age-criteria that defined each specific group.

The projections of private households are obtained through two steps. The first one consists of calculating the number of private households for the whole country and for urban areas by dividing the projected total and urban populations with their respective mean sizes of household of the country and in urban areas. The second step consists of calculating the number of private households in rural areas by subtracting the number of urban households from the total number of households. The annual newly created households for a given year is the difference between the number of households of the preceding year and the number of households of that year.

CHAPTER 5: PROJECTIONS OF THE TOTAL POPULATION

The size of the total population is an important factor in the estimation of many demographic and socio-economic indicators, as it provides information on the population at risk used as a denominator in computing most of such indicators.

Knowledge of the future size of the total population and its composition by age and sex allows decision-makers and planners to apprehend the future of the population dynamics, and hence be in a better position to effectively assess its needs and design appropriate programmes to meet these needs.

This chapter presents the results of the projections of the total population over the period 2022-2052 according to the three projection scenarios presented in the preceding section.

5.1. Population size

Whatever the scenario considered, the size of the population of Rwanda is expected to increase from 13.2 million in 2022 to 24.2 million in 2052 according the high scenario, 23.8 million according to the medium scenario and 23.4 million according to the low scenario (see Table 5.1). In other words, the population size is expected to increase approximately double its current size during the next 30 years.

At the end of the period covered by the Vision 2050 (year 2050), the population size would be about 23.4 million according to the high, 23.1 million according

to the medium scenarios and 22.7 million according to the low scenario. The degree of uncertainty is usually low for short-term projections. By 2030, that is the end year of the Sustainable Development Goals, the population would be approximately 15.7 million according to the three projection scenarios.

The population size is expected to not vary tremendously across the scenarios though the high scenario is expected to yield a population size of about 0.86 million individuals more than the low scenario.

Table 5.1. Projected population size by projection scenario, 2022-2052 (Mid-year Population)

Projection Mid-Year	Population size		
	High Scenario	Medium Scenario	Low Scenario
2022	13,206,731	13,206,731	13,206,731
2023	13,499,656	13,499,134	13,498,611
2024	13,800,155	13,798,561	13,796,964
2025	14,108,214	14,104,965	14,101,706
2026	14,423,666	14,418,145	14,412,600
2027	14,746,250	14,737,803	14,729,313
2028	15,075,696	15,063,640	15,051,507
2029	15,411,725	15,395,339	15,378,830
2030	15,754,101	15,732,629	15,710,973
2031	16,102,628	16,075,281	16,047,669
2032	16,457,107	16,423,064	16,388,509
2033	16,817,301	16,775,708	16,733,030
2034	17,182,921	17,132,899	17,080,855
2035	17,553,613	17,494,219	17,431,549
2036	17,928,898	17,858,979	17,784,561
2037	18,308,202	18,226,565	18,139,264
2038	18,690,979	18,596,391	18,495,048

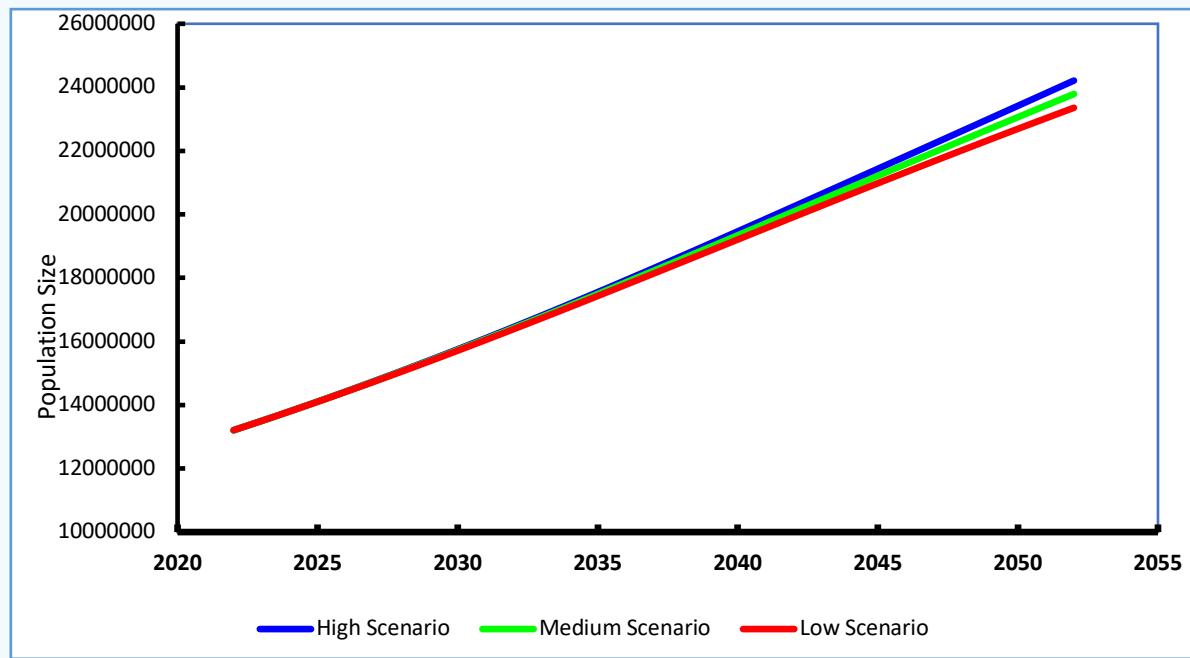

Projection Mid-Year	Population size		
	High Scenario	Medium Scenario	Low Scenario
2039	19,077,155	18,968,311	18,851,722
2040	19,466,201	19,341,762	19,208,703
2041	19,857,454	19,716,059	19,565,308
2042	20,250,317	20,090,630	19,920,968
2043	20,644,388	20,465,139	20,275,332
2044	21,039,473	20,839,343	20,628,114
2045	21,435,255	21,212,882	20,978,999
2046	21,831,442	21,585,415	21,327,455
2047	22,227,792	21,956,640	21,673,212
2048	22,624,265	22,326,433	22,016,073
2049	23,020,951	22,694,774	22,355,932
2050	23,417,853	23,061,561	22,692,602
2051	23,815,071	23,426,776	23,025,978
2052	24,212,725	23,790,420	23,355,976
% Increase (2022-2052)	83.3	80.1	76.8

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

The curve of the future population size per year, as illustrated in Figure 5.1, confirms that the difference between the three scenarios is not substantial. The population size from the low scenario starts being different from the two other scenarios around year 2035. The projected population size from the high and

medium scenarios is expected to remain close up to 2040. This implies that the evolution of the total population for the next 5 years is unlikely to be influenced by any existing or new policies and programmes. The difference in terms of the impact is expected to be visible after 2035.

Figure 5.1. Projected population size by projection scenario, 2022-2052

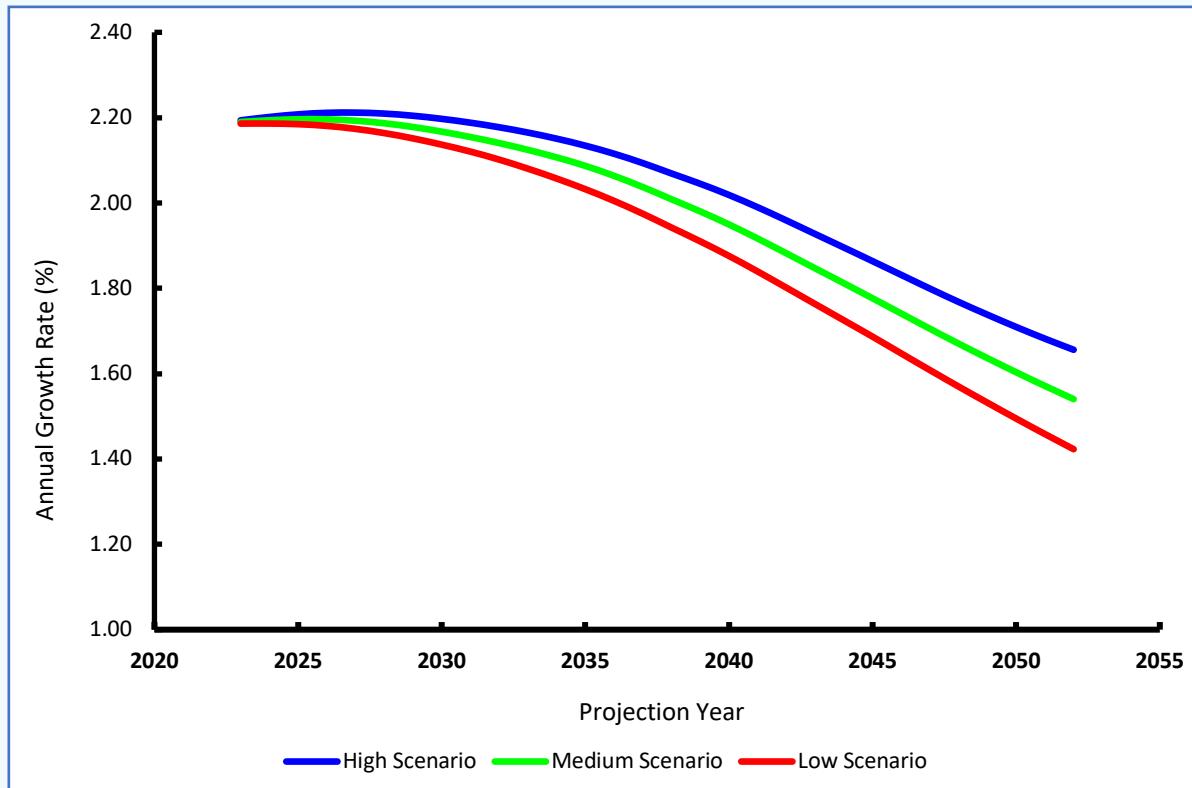

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

5.2. Population growth

The projected population size between 2022 and 2052 described above corresponds to the annual growth rates plotted in Figure 5.2. They reveal that although the size of the population is expected to increase continuously, the pace of this increase is bound to continuously decrease over time.

For instance, the annual growth rate is expected to decrease from 2.3% in 2022, 2.2% in 2023 to 1.7% in 2052 according to the high scenario, 1.5% according to the medium scenario and 1.4% according to the low scenario.

Figure 5.2. Projected annual population growth rates by projection scenario, 2022-2052

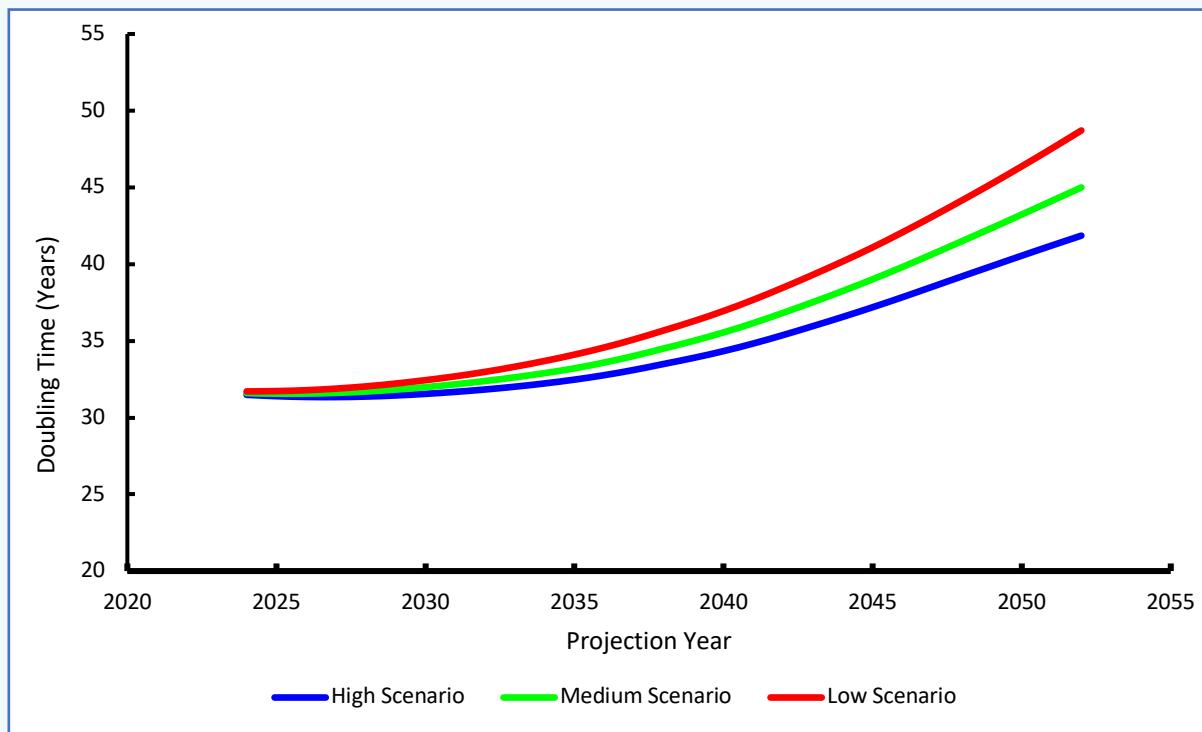

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

The population evolution described above corresponds to different doubling times of the population size as shown in Figure 5.3. Regardless of the scenario, the population doubling time is expected to increase reflecting the slowing down of the population growth. Assuming an exponential

growth, the population of Rwanda would double every 30 years if it had to grow at the same pace as the average one recorded in the intercensal period between 2012-2022. By 2052, this doubling time would increase up to 42 years (high scenario), 45 years (medium scenario) and 49 years (low scenario).

Figure 5.3. Projected doubling time of the population by projection scenario, 2022-2052

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

In summary, the projections show that irrespective of the scenario, the population of Rwanda is expected to continue increasing. It is bound to reach 23.8 million by the end of the projection period (2052) according to the most likely scenario (medium scenario). This is expected to be 0.43 million inhabitants more than the figure from the most optimistic scenario (the low scenario) and 0.42 million less than the high scenario. Though small in proportionate terms, the difference in population sizes between the medium and low scenarios is expected to have a real impact on the limited resources of the country.

In contrast, the difference in terms of population growth and doubling time between the scenarios is expected to be very important. For instance, the doubling time according to the high scenario is expected to be 7 years shorter than that of the low scenario (42 versus 49 years). This means that the type of policies and programmes that is expected to be implemented from now on is expected to have a limited impact on the population of Rwanda in the near future but a significant one on the medium and long run, and even beyond the projection period.

5.3. Population density

The density of the population of Rwanda is expected to continue increasing regardless of all measures currently taken to mitigate its evolution. The current density of 501 inhabitants per square km (mid-year, 503 habitants as of 15 August, 2022) is already one of the highest in Africa. Yet, in the next thirty years, an additional 400 or even more inhabitants per square km are expected to be added depending on the projection scenario.

Table 5.2 reveals that by 2052, the population density of Rwanda is expected to be 919 inhabitants per square kilometer (high scenario), 903 (medium scenario) and 887 (low scenario).

Table 5.2. Projected population density by projection scenario, 2022-2052

Projection year	High scenario		Medium scenario		Low scenario	
	Population	Density (Inhabitants/sq. km)	Population	Density (Inhabitants/sq. km)	Population	Density (Inhabitants/sq. km)
2022	13,206,731	501	13,206,731	501	13,206,731	501
2023	13,499,656	513	13,499,134	513	13,498,611	513
2024	13,800,155	524	13,798,561	524	13,796,964	524
2025	14,108,214	536	14,104,965	536	14,101,706	535

2050	23,417,853	889	23,061,561	876	22,692,602	862
2051	23,815,071	904	23,426,776	889	23,025,978	874
2052	24,212,725	919	23,790,420	903	23,355,976	887

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

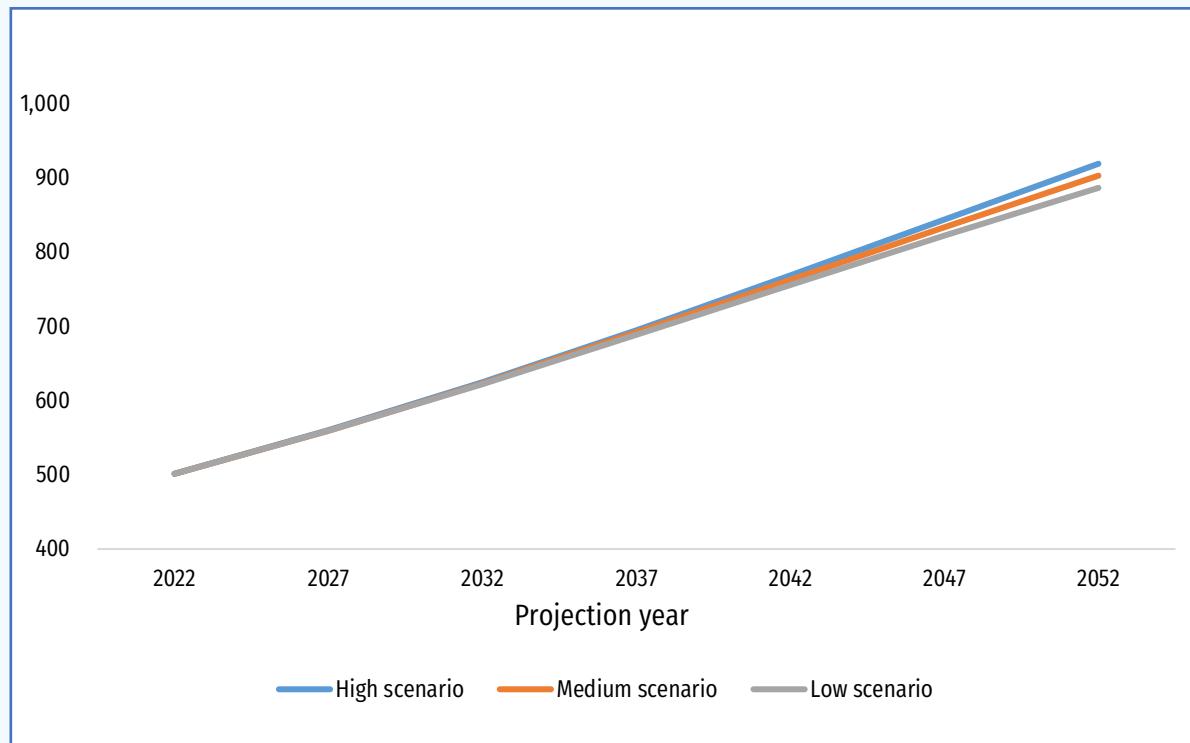

The current fertility level and improvements in human survival would result in an increase in the population and more pressure on land and is likely to exacerbate within the next three decades, irrespective of the policies and programmes implemented, thus the population density will increase all the time (see Figure 5.4).

Therefore, the country needs to put in place explicit policies to deal with unavoidable and foreseeable population overcrowding aside from the current policies aimed at reducing the population growth rate. Among measures to curb the fertility level, we

should think about high quality education among adolescent especially girls and the increase of sensitization on family planning, improving reproductive health programmes including accessibility of contraceptives commodities.

One of measures addressing the population pressure on agriculture land would be to accelerate urbanization in order to free agricultural lands and change the mode of construction from low to high standing and maximizing housing plots but also provide recreational services in urban areas and put in place measures to tackle environmental issues.

Figure 5.4. Evolution of the projected density (2022-2052)

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

5.4. Age-sex structure of the population

Figure 5.5 below shows the age pyramids of Rwanda by 2052 according to the three projection scenarios. When these are compared to the 2022 pyramid, the comparison reveals that:

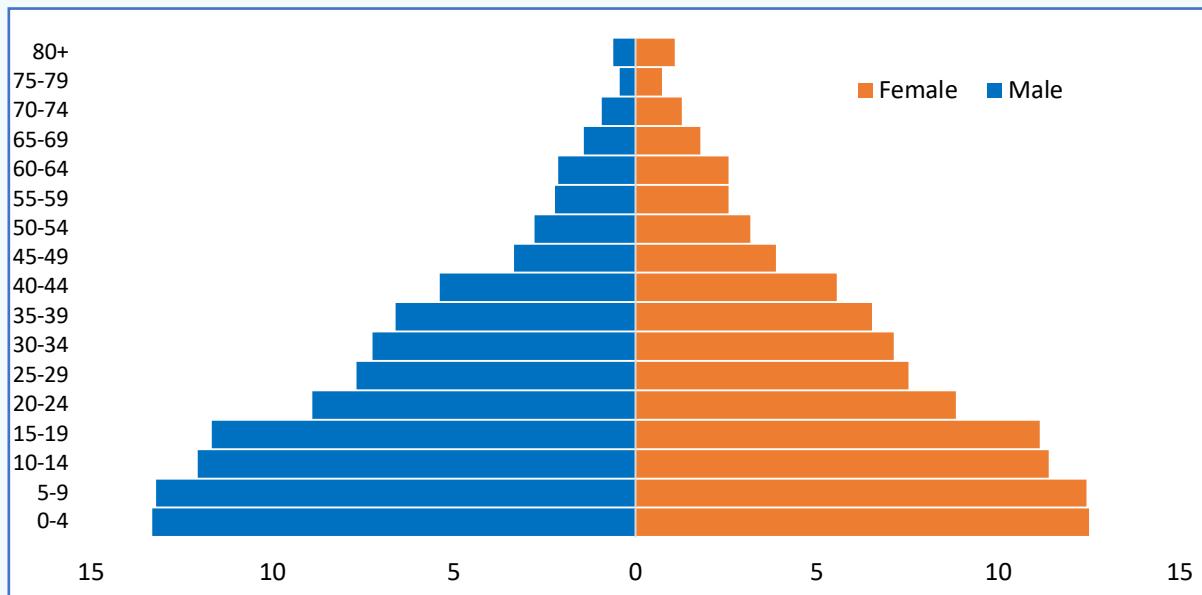

- In 2052, the age pyramid of Rwanda is expected to be quite different from the current one irrespective of the projection scenario. The major change is expected to be the decrease in the share of children (0-14) in the total population and the increase in the share of the population aged 15-59. This means that the population is expected to be less younger in the future.
- The 2052 age-pyramid varies according to the projection scenario. The age pyramid from the high scenario in 2052 is expected to be similar to the one of countries with high fertility but with a greater share of the population aged 15-59. According to the medium scenario, children aged 0-4 and 5-9 is expected to continue to have the highest

population share but with smaller differences as compared to the older age groups. The low scenario gives a pyramid that no longer has the shape of countries with recent high levels of fertility and past adult mortality; children aged 0-4 would no longer have the highest share among all age groups, a consequence of substantial fertility decline.

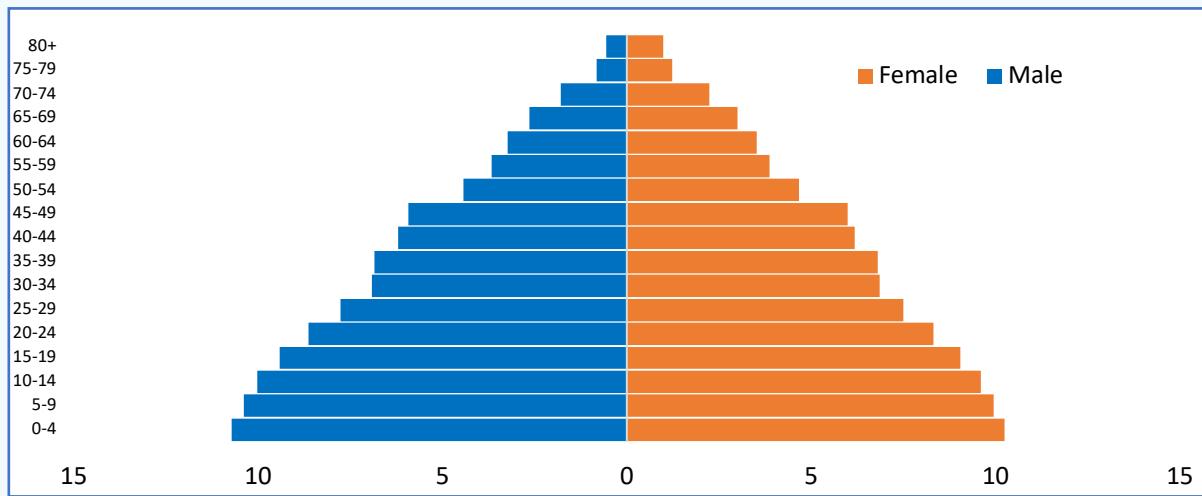

- The expected decline in fertility and mortality would create a bulge in the working-age population; a demographic window to be seized by investing in the youthful population, and the top of the pyramid is expected to gradually expand over time with a higher representation of elderly in the population.

Details of the expected changes in the age-sex structure of the population over the projection period are presented in Table 5.3.

To better understand the evolution of the age-sex structure of the population over the projection period, expected changes in selected indicators that capture the dynamics of the age-sex structure are analysed: percentage of females; sex ratio; percentage of the population in the age groups 0-4, 5-15, 16-64 and 65+; and the age dependency ratio.

The projections are presented in Table 5.4 for the high scenario, Table 5.5 for medium scenario, and Table 5.6 for low scenario.

The projections in the tables confirm that:

- The sex structure of the population is expected to remain mostly unaltered across the projection period. The share of females in the population is expected to be around 51% throughout the projection horizon according to the three scenarios;
- In contrast to the sex structure, the age structure of the population is expected to vary overtime and across the projection scenarios. The population is expected to be less young in

the future and this trend is expected to be more marked for the low scenario followed by the medium and the high scenario. For instance, the median age is expected to increase from 21 years in 2022 to 26, 27 and 28 years by 2052, according to the high, medium and low scenarios respectively. Similarly, the percentage of population under 15 years is bound to decrease from 37.4% in 2022 to 30.5% in 2052 (high scenario), 28.8% (medium scenario) and 27.1% (low scenario). On the other hand, the share of the population aged 16-64 is expected to increase from 56.1% in 2022 to 61.0% in 2052 (high scenario), 62.1% (medium scenario) and 63.3% (low scenario); and

- Based on the projections presented in Tables 5.4-5.6, the percentage of the elderly (60 years

and above) is bound to increase gradually from 6.5% in 2022 up to 10%, 10.7% and 11.5% in the next 30 years depending on the high, medium, and low projections scenarios. Those aged 65 years and above are expected to increase from 4.2% in 2022 to as high as 6.6%, 7.2% and 7.8% in 2052 depending on the high, medium, and low projections scenarios. This suggests that although ageing in Rwanda is not as rapid as elsewhere in the developed societies, the absolute number of people aged 65 and above is bound to continue increasing in the future. This situation is expected to have implications for social support, health care and living arrangements but also crucial for retirement planning.

5.5. Fertility indicators

This sub-section reviews the projections of key fertility indicators between 2022 and 2052 according to the three projection scenarios. These indicators are useful for planning, monitoring and evaluation purposes within various programmes and projects. For instance, the number of annual births in the future is useful in allocating health care and education resources in terms of forecasting the requisite number of nurses to be trained to ensure that there is sufficient skilled birth attendants.

They are also useful in designing targeted family planning and reproductive health programmes, and for planning the expansion of health care, child care and pre-school institutions. The net reproduction rate (NRR) is yet another useful indicator to understand population growth. The NRR should be 1 or above to ensure replacement of the population. Therefore, keeping track of its value over time is useful in order to avoid crossing the redline that would signify the beginning of a decline in the total population. For instance, an NRR of 1.4 by 2052 would suggest that, subject to fertility and mortality conditions prevailing, the size of the population in 2052 would be 25% more than the current size of the Rwandan population.

Table 5.7 presents the projections of key fertility indicators by the three projection scenarios for selected years. It reveals that:

- The trend in the number of annual births varies according to the projection scenario. The future number of annual births in Rwanda is expected to be determined by the reproductive behaviour and intentions of cohorts of individuals who is expected to enter the reproductive ages over the next three decades. The number of annual births is likely to increase continuously based on the high scenario, while it is expected to start decreasing from a certain point in time (around 2045) according to the medium and low scenarios.
- To analyse this trend in detail, a graphical illustration of the expected number of annual births by single year is presented in Table 5.7. The standardized birth rate (standardized number of annual births per 1,000 inhabitants) is bound to decrease from 28 per 1000 in 2022 to 20.5 per 1000 in 2052 (medium scenario).

Table 5.7. Projection of key fertility indicators by projection scenario, 2022-2052

Fertility Indicator	Projection year										
	2022	2023	2024	2025	2026	2027	2032	2037	2042	2047	2052

General Fertility Rate (GFR)	106.9	104.6	103.3	102.1	101.0	100.0	95.1	90.4	83.4	74.7	67.0

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

Figure 5.6 clearly shows the difference in the trend of the projected number of annual births by the projection scenario as the number varies substantially according to the scenario.

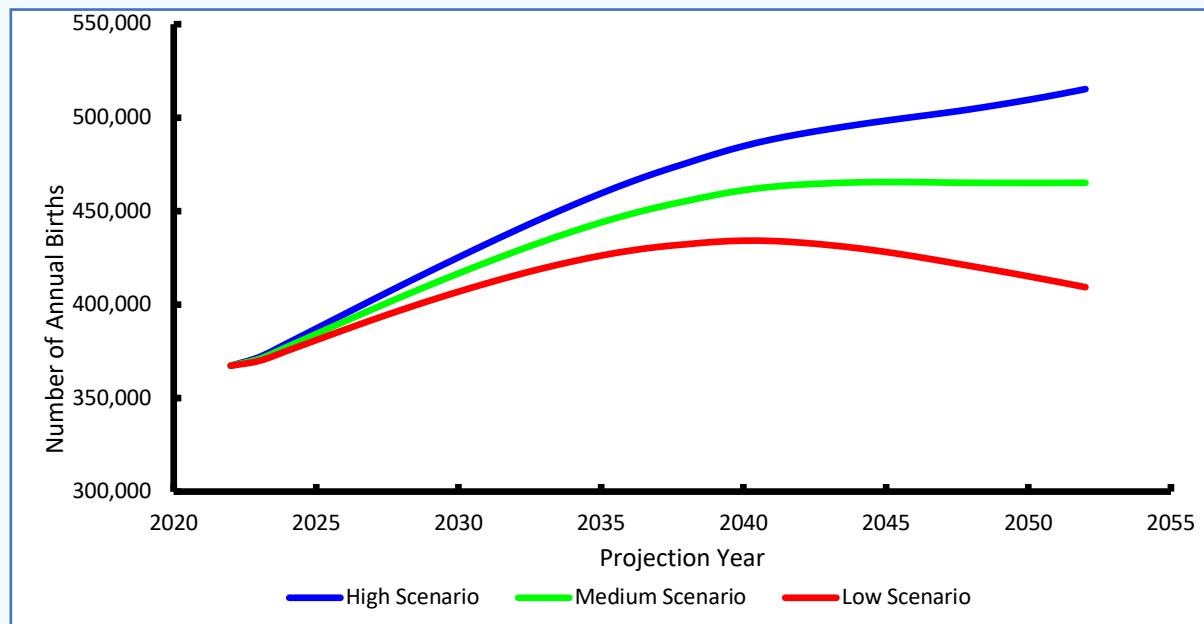

- According to the high scenario, the number of annual births is expected to increase continuously to reach some 440,000 births by 2032. The increase in the number of annual births is attributed to the phenomenon of population momentum which implies that the number of births is expected to continue to increase for a while because the cohorts of their mothers are already born.
- The medium scenario (the most likely one) shows two phases in the evolution of the projected annual number of births: a first phase of increase that covers the period 2023 to 2044, followed by a second period where the number

of annual births is expected to stabilize around 465,000 (2045-2052).

The trend from the low scenario is less regular. If the TFR decreases down to 2.3 children per woman by 2052, the annual number of births shows two phases: a first phase of an increase that covers the period 2022 to 2040, followed by a period of a steady decrease to around 409,000 by 2052.

The figure below and Table 5.7 show that the difference in terms of annual births between the projection scenarios is expected to widen over time: 521,327 births (high scenario), 465,194 (medium scenario) and 409,340 (low scenario) by the end of the projection period. In other words, the choices made in terms of policies and programmes are expected to substantially affect the number of annual births gradually at the beginning and more intensively as we approach 2052.

Figure 5.6. Projection of the number of annual births by projection scenario, 2022-2052

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

Table 5.8 shows the projection of other key fertility indicators at selected dates over the projection period. As assumed, the TFR is expected to decrease for all projection scenarios from 3.6 children per woman in 2022 to 2.9 (high scenario), 2.6 (medium scenario) and 2.3 (low scenario) in 2052. These assumptions imply that the replacement of the population is expected to be ensured according to all the three scenarios since they have an NRR value

greater than 1 (1.4, 1.3 and 1.1) daughters on average per woman according to the high, medium and low scenarios respectively).

The table 5.8 also shows that the timing of childbearing is not expected to vary substantially across the projection scenarios; the mean age at childbearing is expected to decrease slightly from 30 years in 2022 to 29.5 years in 2052.

Table 5.8. Projection of other key fertility indicators by projection scenario, 2022-2052

5.6. Mortality indicators

Table 5.9 reveals a downward trend in mortality over the projection period, irrespective of the projection scenario. However, the decrease in mortality is expected to be greater under the low scenario and less under the high scenario. Life expectancy at birth for both sexes is likely to increase from 69.7 years in 2022 to 81.4 years (low scenario), 78.0 years (medium scenario) and 74.8 years (high scenario) in 2052. Seemingly, infant mortality rate is expected to decrease from 29 per 1000 live births in 2022 to levels as low as 14 per 1000 (high scenario), 7 per 1000 (medium scenario) and 4.1 per 1000 (low scenario) in 2052.

Table 5.9. Projection of key mortality indicators by projection scenario, 2022-2052

Other Key Mortality Indicators	2022	2023	2024	2025	2026	2027	2032	2037	2042	2047	2052

CHAPTER 6: PROJECTIONS OF THE URBAN POPULATION

This chapter discusses the projections of different aspects of the urban population between 2022 and 2052 according to the high, medium and low projection scenarios, i.e. population size, population density and population age-sex structure. Before presenting the projections, the strategies of urban planning based on the revised Vision 2050 target are examined.

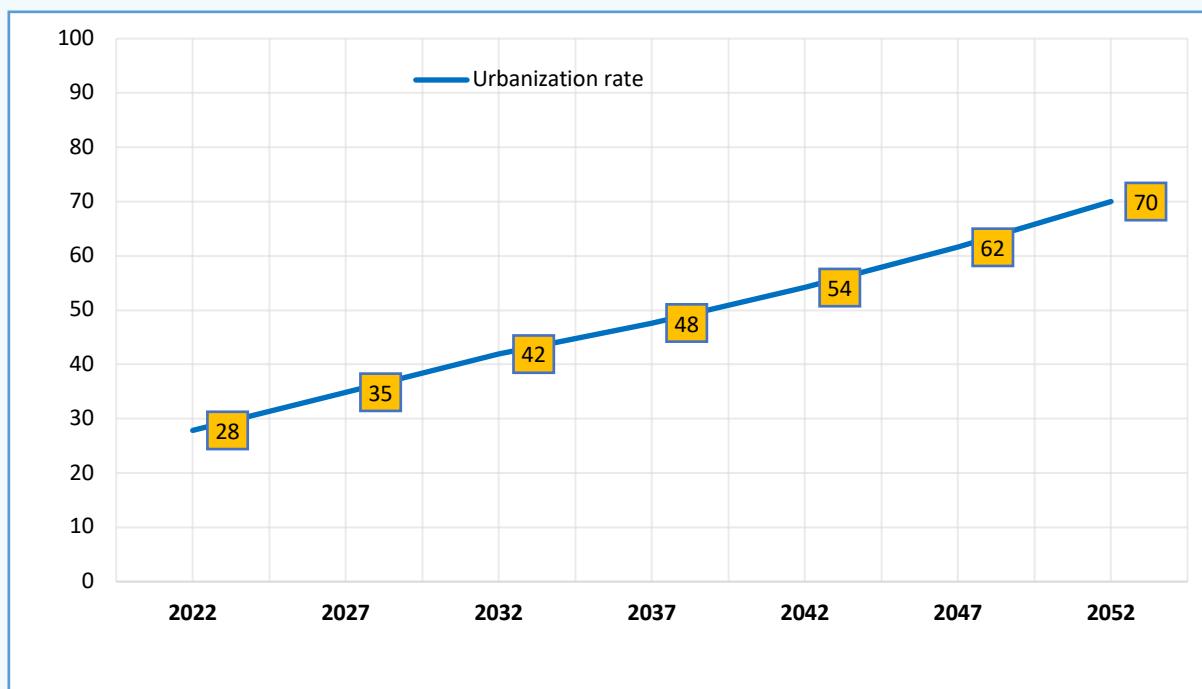

6.1. An overview of the current official policy on urbanization

Vision 2050 states that "as one of the future drivers of the country's growth, the overarching objective is to have 70% of the population living in urban areas by 2050". Table 6.1 and Figure 6.2 are the simulation of what would be the size of the urban population between 2022 and 2052 based on the Vision 2050 target.

Accordingly, the size of the urban population in 2052 is bound to be about 4.6 times greater than its current

size. It is expected to increase from 3.7 million in 2022 to at least 16.2 million (low scenario), 16.5 million (medium scenario) and 16.8 million (high scenario) by 2052. Such a rapid increase in a period of 30 years means that huge investments in terms of infrastructure is expected to be required to accommodate at least 12.5 million more urban dwellers.

6.2. Size of the urban population

As presented in figure 6.2 and table 6.2, the urban population is expected to increase from 3.7 million in 2022 to 16.8 million (high scenario), 16.5 million (medium scenario) and 16.2 million (low scenario) by 2052.

This corresponds to an overall increase of 361%, 353% and 344% respectively in the next 30 years, equivalent to more than 4 times the expected increase rate in the total population.

At the end of the period covered by Vision 2050, the urban population is expected to be just above 15 million, regardless of the projection scenario. This is still high and is expected to require huge investments in infrastructure and resources within urban areas.

6.3. Age-sex structure of the urban population

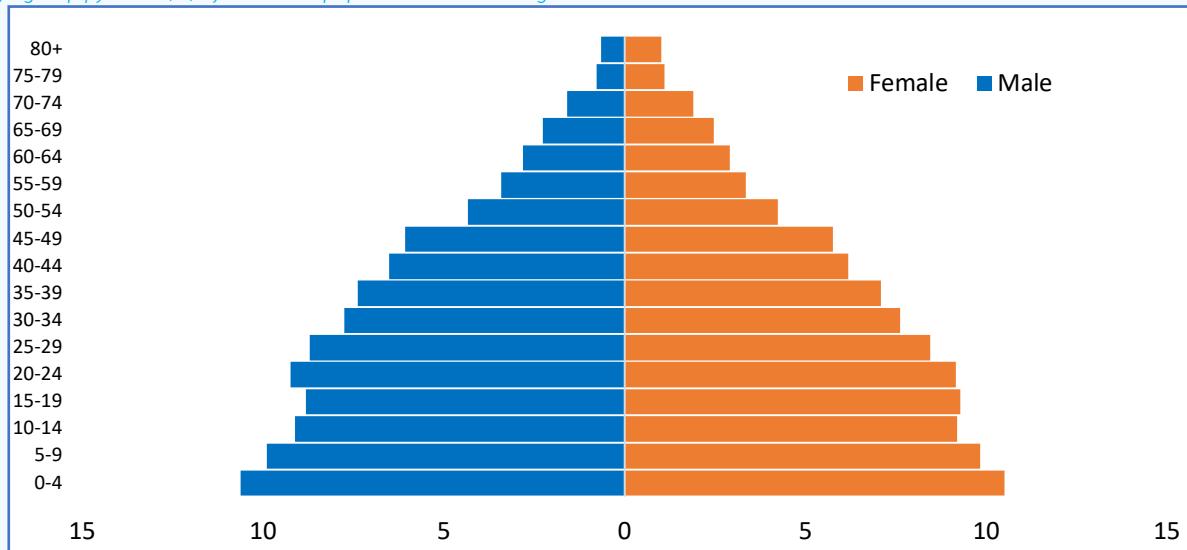

Figure 6.3 shows a comparison of the age pyramids of the urban population in 2022 and 2052 under the three projection scenarios in comparison of that of 2022. It shows that at the end of projection period, the age-sex structure of the urban population is expected to change, regardless of the projection scenario.

- The population in the 25-54 age group is expected to have the greatest share of the total urban population by 2052, as in 2022. This age group forms the majority of the working-age population. The number of males is expected to continue to slightly out-number the number of women in this age group. The share of the child population is expected to decrease while the share of the elderly is expected to increase under all the three projection scenarios.

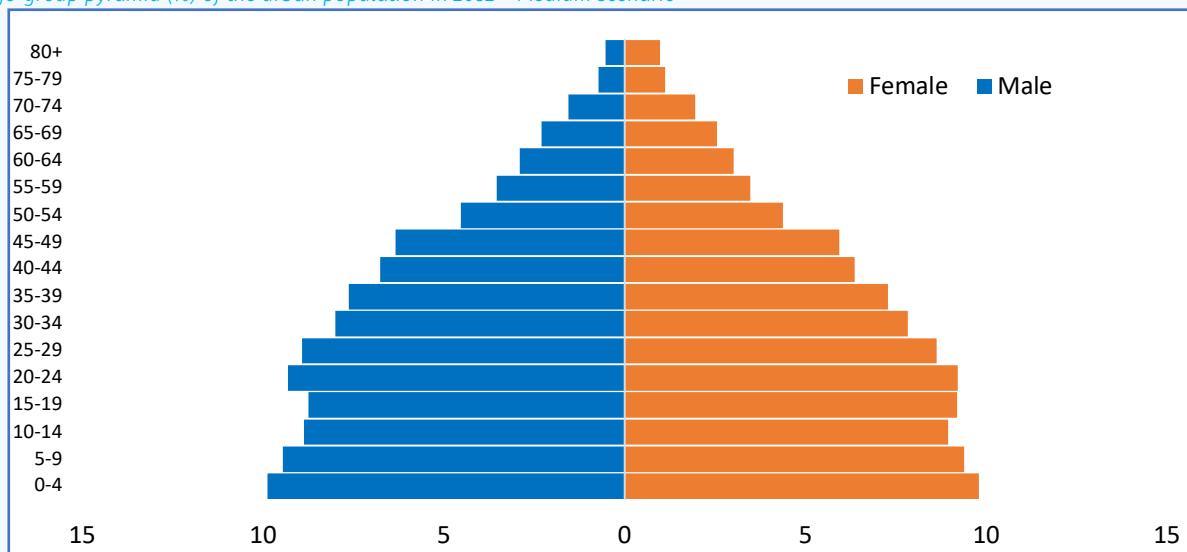

Figure 6.3. Comparison of the 2022 and 2052 age pyramids of the Rwandan urban population by projection scenario
Age-group pyramid (%) of the urban population in 2022

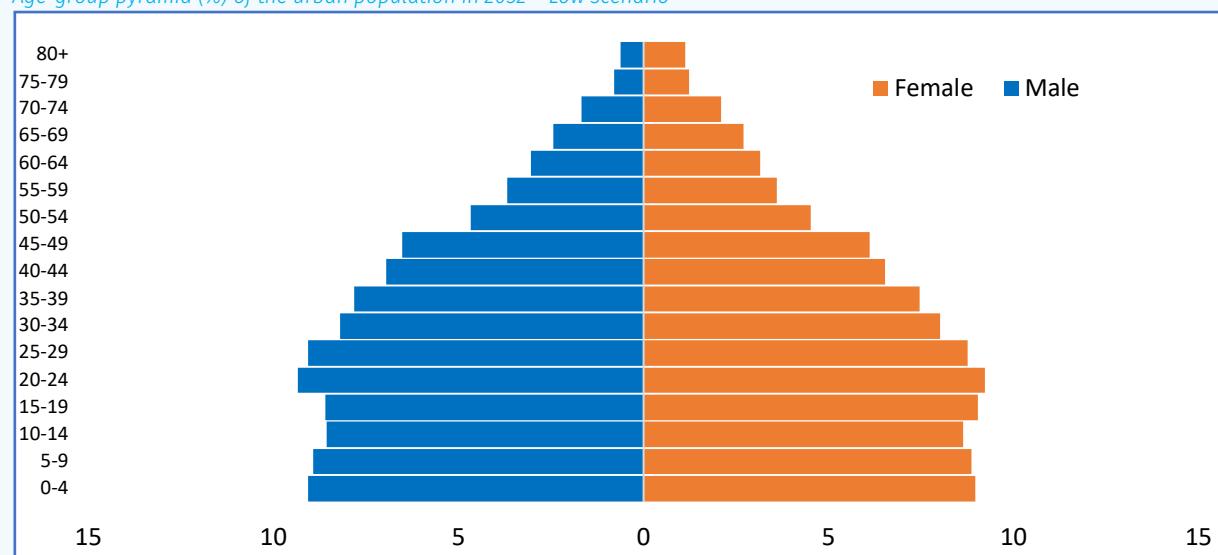

Age-group pyramid (%) of the urban population in 2052 – High scenario

Age-group pyramid (%) of the urban population in 2052 – Medium scenario

Age-group pyramid (%) of the urban population in 2052 – Low scenario

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

Table 6.3 presents further details of the changes in age-sex structure over the projection period. The findings in table 6.3 confirm that the age-sex structure of the population is expected to change in some of its aspects and is expected to remain unchanged in others.

In terms of changes, by 2032, the sex structure of the urban population is expected to change slightly; females are expected to out-number males in urban areas with their percentage in the population increasing from 49.8% to 50.4%, under all the three projection scenarios.

The changes in the age structure is expected to be more profound than changes in the sex composition of the population. The urban population is expected

to be less younger over time; the median age is expected to increase from 22 years in 2022 to 24 years in 2032 irrespective of the projection scenario. It will reach 26 years (high scenario), 27 years (medium scenario) and 28 years (low scenario) by 2052.

This trend is reflected in the increasing percentages of the age-groups 16-64, 60+, and 65+, and the decrease in the percentage of children aged 0-4 and 5-15. For instance, the 16-64 age group is expected to constitute 63% of the urban population in 2032 according to the three scenarios when compared to 61% in 2022. The population's share of the elderly aged 60 years and above is expected to increase from 4% in 2022 to 9% in 2052, and the elderly aged 65 years and above from 3% to 6% during the projection period (medium scenario).

Table 6.3. Evolution of the age-sex structure of the urban population by projection scenario, 2022-2052

Age-sex structure Indicators	Projection Year

6.4. Density of the urban population

Table 6.4 presents the projected density of the urban population by projection scenario. It reveals that the population density in urban areas was already high in 2022 with 1,695 inhabitants per square kilometre and this is expected to increase substantially over time. If the urban surface area remains unchanged over time, the density of the urban population is bound to be 7,813 (high scenario), 7,677 (medium scenario) and 7,536 (low scenario) by 2052.

However, as articulated in the fourth pillar of Vision 2050, the national aspiration is that the urban surface area is expected to increase as new settlements are expected to be created around the existing urban areas to accommodate the growing urban population. Therefore, the actual population density in urban areas is bound to be somehow different from the ones presented in Table 6.4, but is expected to be still high.

CHAPTER 7: PROJECTIONS OF THE RURAL POPULATION

This chapter describes the projections of the rural population between 2022 and 2052 according to the high, medium and low projection scenarios by focussing on the size, density and age-sex structure. All the three projection scenarios are based on the assumption that the urban population is expected to experience a steady increase from 27.9% in 2022 up to 70% by 2052. This translates to a decrease in the percentage of the projected rural population from 72.1% to 30% between 2022 and 2052 as shown in the Table 7.1. and Figure 7.1.

Table 7.1 and figure 7.1 show that the projected rural population is bound to increase from 9.5 million in 2022 to: 9.6 million in 2027, then start decreasing up to 7.3 million (high scenario), to 7.1 million (medium scenario), and to 7.0 million (low scenario) in 2052. This corresponds to a decrease in the projected size of the rural population by 24.0%, 25.0% and 26.5% between 2022 and 2052, according to the high, medium and low projection scenarios respectively.

7.2. Age-sex structure of the projected rural population

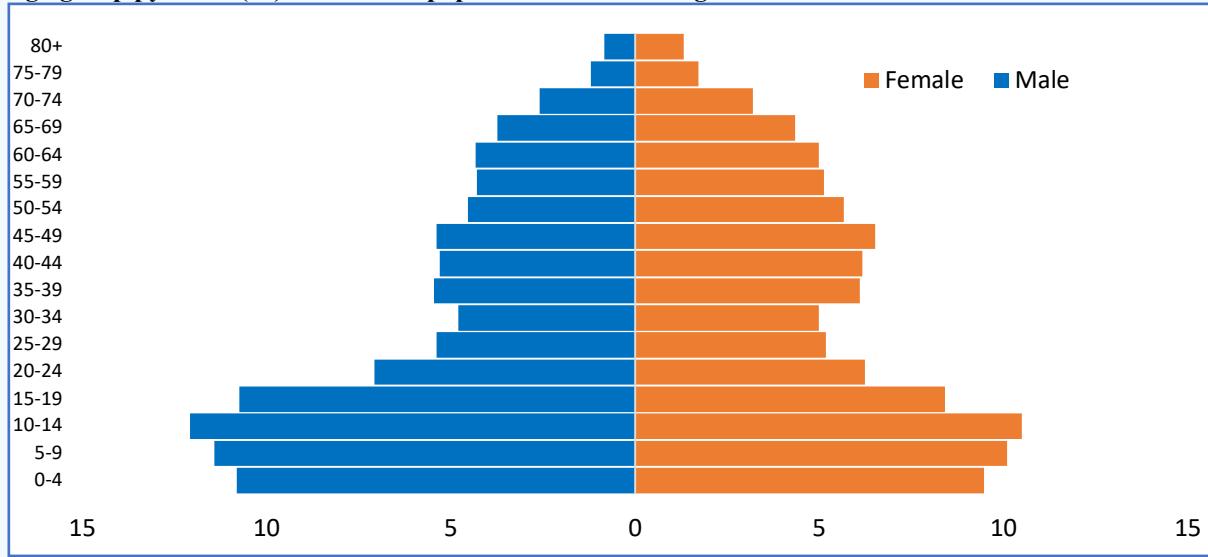

Figure 7.2 compares the age pyramid of the rural population in 2022 with the age pyramids of the projected rural population in 2052 by projection scenario. It shows that by the end of projection period, the age-sex structure of the rural population is expected to change based on the assumptions regarding future growth of the urban population. The rural population is expected to be less young as evidenced by a marked decrease in the share of children and an increase in the share of the population in older age groups.

A marked difference in the population age-sex structure between that in 2022 and those in 2052 is a dip in the proportion of the population aged 20-34 across the three projection scenarios. This is in line with the expected sharp increase in the projected urban population, i.e. a sizeable proportion of young people is expected to move from rural to urban areas.

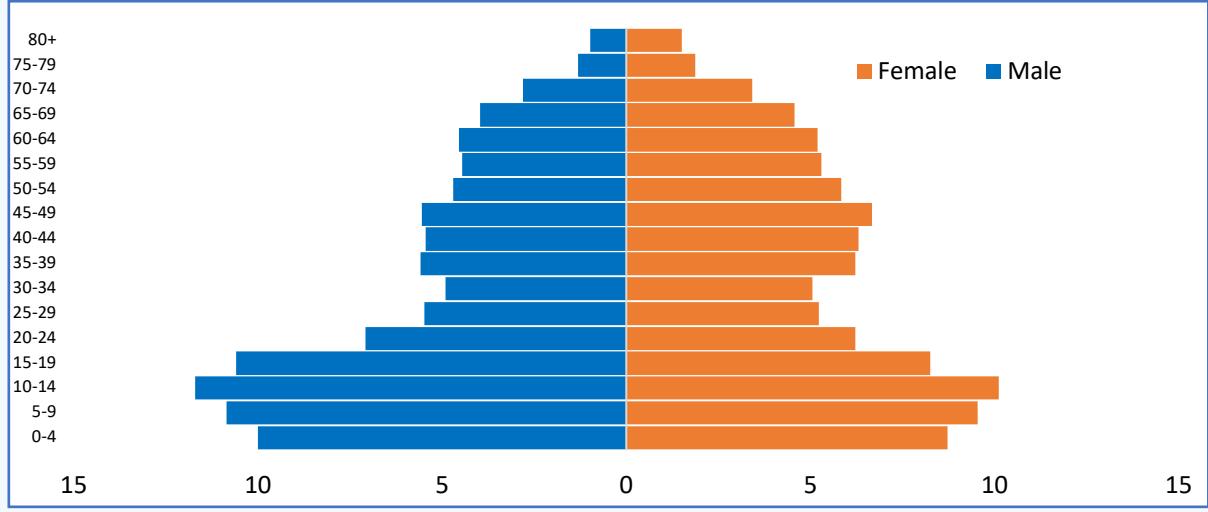

Figure 7.2. Comparison of the 2022 and 2052 age pyramids of the rural population by projection scenario
Age-group pyramid (%) of the rural population in 2022

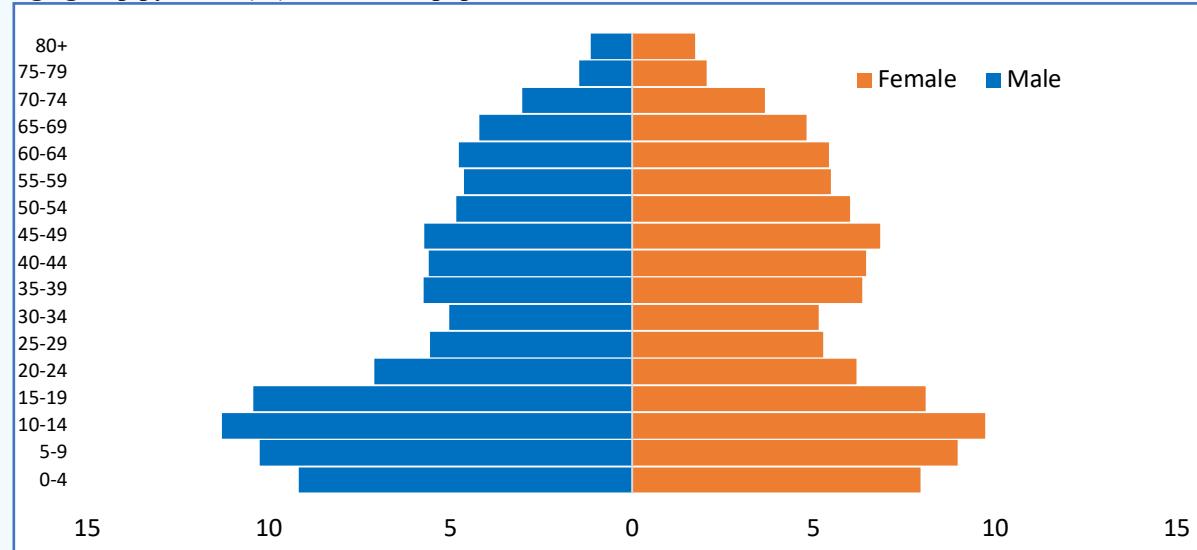

Age-group pyramid (%) of the rural population in 2052 – High scenario

Age-group pyramid (%) of the rural population in 2052 – Medium scenario

Age-group pyramid (%) of the rural population in 2052 – Low scenario

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

Table 7.2 provides more detailed information on the changes that are expected to influence the age-sex structure. It is indicated in this table that irrespective of the projection scenario, the share of women in the rural population is expected to decrease slightly (from 52% in 2022 to 50.4% in 2052). The rural population is expected to become less and less young over time. The median age is expected to

substantially increase from 20 years to 27 years (high scenario); to 28 years (medium scenario); and to 30 years (low scenario). Elderly people aged 60 years and above accounted for 7% of the rural population in 2022 but their share is expected to be greater than 8% in 2032 and close to 16% in 2052. A similar upward trend is expected in the share of the population aged 15-64 years.

7.3. Density of the projected rural population

The density of the projected rural population is expected to increase marginally up to about 2035, then start a downward trend as depicted in Table 7.3. Thirty years from 2022, this figure is bound to be 301 (high scenario), 295 (medium scenario) and 290 (low scenario) inhabitants per square kilometre.

However, the true density is expected to be greater than these figures given that the surface area covered by urban areas is expected to increase as discussed in section 6.4 above, implying a reduction in the surface area for rural areas.

Table 7.3. Density of the projected rural population by projection scenario, 2022-2052

In any case, an increase in the population density is unavoidable. As the population density increases, the pressure on land is expected to become greater with increasing urbanization. Consequently, more arable land is likely to experience change of land use due to a shift from agricultural to non-agricultural activities. Whichever the solution, this problem is expected to require that special attention be paid to ensure that

other emerging issues do not complicate the situation further. For instance, a shift to non-agricultural activities should not translate into a decrease in the agricultural production. Such a choice should, therefore, be accompanied by an intensification and modernization in the agriculture sector.

CHAPTER 8: PROJECTIONS OF SPECIFIC INTERVENTIONS TARGET GROUPS

This chapter presents the findings on the following specific interventions target groups: school-age population, working-age population, elderly, children, youth, women in the reproductive age groups and legal majority age-groups.

All the projections are based on the medium (the most likely) scenario. The evolution of the sizes of these age groups is important when assessing their specific needs and to better plan, implement, monitor and evaluate the relevant interventions.

8.1. School-age population

There has been a change in the official school-age groups since 2021: from 3-6 years to 3-5 years for pre-school; from 7-12 years to 6-11 years for primary level; and from 13-18 years to 12-17 years for secondary level. At the national level, the school-age population in the former system is expected to increase from 5.1 million to 7.2 million between 2022 and 2052, equivalent to a percentage increase of 40% over the next thirty years (Table 8.1, Table 8.2, and Table 8.3). Similarly, the current system is expected to experience an increase from 4.8 million to 6.8 million (40%) over the same period.

The expected change in the school-age population displays marked differences by place of residence.

While the expected increase in the school-age population will be 279% in urban areas between 2022 and 2052. The opposite is bound to happen in rural areas with an expected decrease of 40% between 2022 and 2052. The expected increase in urban areas with the corresponding decrease in rural areas in the school-age population can be attributed to the expected rapid growth in the population in urban area from 27.9% in 2022 to 70% in 2052. This suggests the need for huge investments in physical infrastructure and human resources in urban areas over the next 30 years, especially if the “Education for all” policy is to be achieved during the projection period.

8.2. Working-age population

The official working age group in Rwanda is 16-64 years. The size of this working-age population is expected to increase from 7.4 million in 2022 to 14.8 million in 2052, corresponding to an increase of 99.6% (Table 8.4). This increase is expected to be even higher in urban areas where the working-age population is expected to increase threefold (376.5%) in thirty years only. In contrast, rural areas are expected to experience a decrease of about 20.6% in 2052.

Table 8. 4. Evolution of the working-age population by area of residence, 2022-2052 - Medium scenario

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

Figure 8.1 shows the evolution of the age dependency ratio, which is the number of persons whose age is out of the working age-group per 100 persons in the working-age group. The results show that the proportion of dependents is expected to be on the decline as the working-age population increases over time. The age dependency ratio is expected to decrease from: 70 dependents per 100 working-age individuals to 56 for the country as a whole; 58 to 52 in urban areas; and 77 to 69 per 100 working-age individuals in rural areas. The age dependency ratio

is expected to remain higher in rural areas than in urban areas throughout the projection period.

The downtrend in age dependency ratio may be partially a consequence of the decline in fertility over the projection period. In line with this, it is expected an increase in survivors over age 65, to some extent offset by a decline in the absolute number of child population aged below 16.

Figure 8. 1. Evolution of the age dependency ratio by place of residence, 2022-2052 - Medium scenario

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

8.3. Elderly population

In Rwanda, the formal retirement age is now 65 years old, whereas the international definition uses 60 years as the lower limit. The analysis considered both age-groups .

Table 8.5 shows that the size of the elderly aged 60 and above is expected to have doubled between 2022 and 2052, an increase of 196%. The increase is expected to be even more substantial in urban areas where the number of the elderly in 2052 is expected to be 9 times greater than in 2022; whereas in the rural areas, the increase is expected to be twofold.

The increase also varies by sex, regardless of the place of residence. The increase in relative terms is expected to be more accentuated among males than females at national and rural levels than in urban areas. For instance, at the national level, the increase in the male elderly population between 2022 and 2052 is expected to be 221% as compared to 178% among females.

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

In absolute numbers, more females than males are expected in the elderly population throughout the projection period. With regard to place of residence, the elderly population is expected to be predominantly concentrated in rural areas. However, the growth rate of the elderly population is expected to be higher in urban than in rural areas. This is partly

driven by the expected fast increase in urban population by 2052.

For national planning purposes, Table 8.6 presents the evolution of the size of the population aged 65 years and above. The results confirm similar patterns as those observed in Table 8.5.

Table 8.6. Evolution of the size of the elderly (65 years and above) by sex and place of residence, 2022-2052 - Medium scenario

As discussed earlier, the increase in the size of the elderly aged 60 years and above is not huge in terms of percentages: 7% in 2022 to 16% in 2052. However, this does not mean that aging is expected not to be an issue of concern in Rwanda. The challenge for the government is to secure requisite resources towards meeting various needs of the elderly, including infrastructure, health care, etc.

The existing policies in Rwanda that deal with the elderly should pay special attention to these aspects rather than focusing mainly on the absolute size of the elderly. A good starting point would be to conduct an in-depth analysis of the living conditions of the elderly, using the available data sources (PHCs, DHSs and EICVs).

8.4. Other specific intervention target groups

This section presents findings on the size and evolution of certain population sub-groups that form targets of specific interventions or that fall under some legal categories.

These include:

- population targeted by different health interventions (infants below 1 year, children aged 1-4 years, children under five and women in the reproductive ages);
- children aged 0-17 years, youth aged 14-35 years (official definition in Rwanda) and youth aged 15-24 years (international definition); and
- the different age-groups that fall under the legal categories: 14 years and above (criminal responsibility), 16 years above (eligibility to national identification), 18 years above (emancipation age) and 21 years and above (majority age).

The findings on the evolution of these different age-groups by place of residence between 2022 and 2052 are presented in Table 8.7, Table 8.8, and Table 8.9. The sizes of all these age-groups are expected to increase irrespective of the projection scenario. However, the increase is expected to be far more important in urban than in rural areas.

CHAPTER 9: PROJECTIONS OF THE PRIVATE HOUSEHOLDS

This chapter presents the evolution of the number and mean size of private households between 2022 and 2052 as well as the evolution of the annual number of newly created private households between 2023 and 2052. The findings reported here are based on the medium projection scenario.

9.1. Evolution of the number and mean size of private households

Table 9.1 presents the evolution of the number and mean size of the private households between 2022 and 2052 based on the medium projection scenario. It shows that, at the national level, the number of private households is likely to double its current size over the projection period, increasing from 3.3 million in 2022 to 7.9 million in 2052. However, the mean size of the households is expected not to vary a lot, decreasing from 4.0 to 3.0 persons per household. The evolution of the number of households is expected to vary substantially according to the place of residence, while the evolution of the mean size is expected to be similar in both areas.

The number of urban households is expected to increase six fold, from 960 thousands in 2022 to 5.7 million in 2052. The mean size of the households is expected to decrease from 3.8 members per household to 2.9 in the same period. In rural areas, the number of households is expected to increase from 2.3 million in 2022 to 2.6 million in 2040, and then start decreasing up to 2.1 million in 2052. The difference between the change in the expected number of households in urban and rural areas is attributed to the assumed fast growth rate in the urban population. The expected changes in the number of households by place of residence is summarised in Figure 9.1.

Figure 9.1. Evolution of private households by place of residence, 2022-2052 - Medium scenario

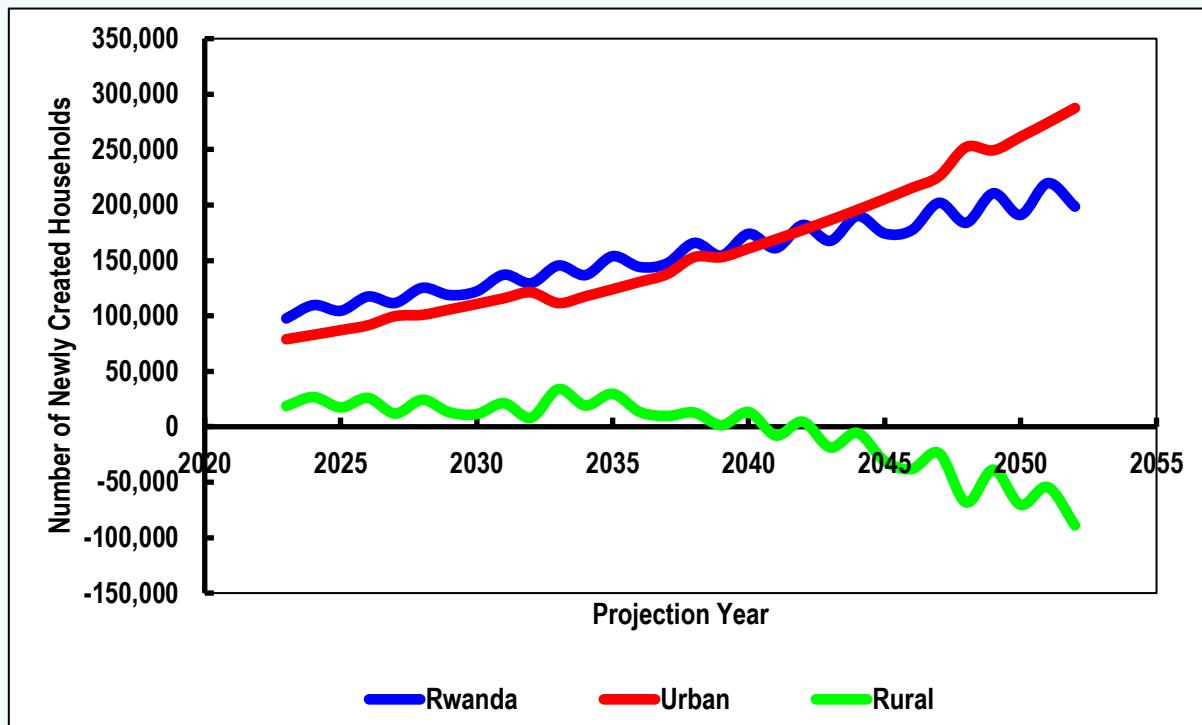

Source: Fifth Rwanda Population and Housing Census, 2022 (NISR)

9.2. Newly created private households

Figure 9.2 presents the evolution of newly created private households between 2023 and 2052. It shows that this number is expected to continuously increase over time: from around 98,000 in 2023 up to about 198,000 in 2052. The evolution of newly created private households varies by place of residence. In urban areas, the annual number of newly created private households is expected to increase rapidly (from about 79,000 to 287,500 between 2023 and 2052), while in rural areas, the annual number of such households is expected to fluctuate, from around 19,000 in 2023 to minus 89,000 in 2052. On average, there is a need to construct annually 155,000 new households at national level and 159,000 new households in urban areas to accommodate more of the population in urban areas.

CHAPTER 10: SUMMARY AND RECOMMENDATIONS

This chapter presents a summary of the population projections for Rwanda based on the 2022 Fifth Rwanda Population and Housing Census (RPHC5). The summary highlights the rationale, methodology, assumptions for the projections; it then documents projections of the different facets of the population. It concludes by offering key recommendations thought to be relevant to future Rwandan censuses.

10.1. Summary

10.1.1. Rationale

Population projections give an indication of what the future population would be if certain likely rates of fertility, mortality and migration were to apply. The projected size, composition, and distribution of the population at various geographic units and points in time form a rational basis to gauge the primary needs of the Rwandan population.

Information from population projections is very critical to all planners of development programmes. Rwanda is not an exception in this regard, particularly after the demographic and social changes the country has experienced in the nearly

three decades following the 1994 genocide against the Tutsi. Consequently, Rwanda has long formulated and implemented explicit policies that have a direct influence on the population growth. This is still the case nowadays with many policies dealing with different sectors related to population and development issues. The design, implementation, monitoring and evaluation of such policies and programmes require up-to-date and reliable data. The objective of the present census report on population projections was to contribute to provision of such data.

10.1.2. Methodology

The standard cohort component method was applied in generating the Rwandan population projections based on the 2022 Fifth Population and Housing Census data. The requisite input information about the components of population change (fertility, mortality and migration) were taken into account during the projections. The projections were generated based on the high, medium and low scenarios that combine assumptions on the future trends in fertility, mortality and migration, as well as considering the pace of current and planned future urbanization and potential size of private households for the next 30 years. The changes in the projections are expected to be more aligned to the medium scenario since it is the most likely one to shape the future course of population. The high scenario assumes a full achievement of all planned interventions while the low scenario assumes a slow response to all existing and future interventions.

The assumptions and scenarios were formulated based on an analysis of: (i) past policies and programmes that have already influenced or likely to influence population growth in the near future; (ii) the trends of selected key indicators; and (iii) the targets in the current policies and programmes, especially the Vision 2050 aimed at transforming Rwanda into an upper-middle income country by 2035, and a high income country by 2050.

The current decline in fertility is expected to continue over time with the total fertility rate decreasing from 3.6 children per woman to 2.6 in 2052 (medium scenario). Mortality is also expected to decrease, irrespective of the projection scenario. According to the medium scenario, life expectancy at birth is likely to increase from 69.6 years to 78.0 years for both sexes while infant mortality rate is likely to decrease from 29 per 1,000 live births in 2022 to 7 per 1,000 live births in 2052.

10.1.3. Population Projections

Based on the medium projection scenario, the main findings follow here below.

The Rwandan population is expected to increase in the next 30 years: from 13.2 million in 2022 to 23.8 million by 2052. A direct consequence of this anticipated increase in the population is the unprecedented increase in population density: from 501 inhabitants per square kilometre in 2022 to 903 inhabitants per square kilometre by 2052.

The projected population is expected to be less young in the future with the median age increasing from 21 years in 2022 to 27 in 2052. Consequently, the percentage of adults and old people in the population is expected to increase over time, while the share of children is expected to decrease proportionately during the projection period.

The urbanization rate is expected to increase from 27.9% in 2022 to 70.0% in 2052. This rapid growth will translate the current size of the urban population by a factor of about 4.5 times in the next 30 years; i.e. from 3.7 million in 2022 to at least 16.65 million by 2052. The urban population is expected to be 16.65 million in 2052 as compared to 3.7 million in 2022, equivalent to an increase of about 352.8%. Just like the total population, the urban population is expected to be less young with a median age increasing from 22 years to 27 years between 2022 and 2052. On the other hand, the rural population is expected to be 7.1 million in 2052 as compared to 9.5 million in 2022, equivalent to a decrease of about

26%. The rural population is expected to also be less young with a median age increasing from 20 years to 30 years between 2022 and 2052.

The sizes of specific population sub-groups such as the school-age population, the working-age population, the health interventions group, the elderly, the children and youth, and the legal age-groups categories are expected to increase substantially over the next 30 years, especially in urban areas. For instance, at the national level, the school-age population in the former system is expected to increase from 5.1 million to 7.2 million between 2022 and 2052, equivalent to an increase of 40%. Similarly, the current system is expected to experience an increase from 4.8 million to 6.8 million (40%) over the same period with marked differences by place of residence.

The number of private households is expected to increase from 3.3 million to 7.9 million between 2022 and 2052. It is expected to increase six fold in urban areas with hardly any change in rural areas. The mean size of the households is expected to vary slightly, decreasing from 4.0 members per household in 2022 to 3.0 in 2052 with little variation between urban and rural areas. The annual number of newly created households is expected to increase continuously over time: from around 98,000 in 2023 up to about 198,000 in 2052.

10.2. Recommendations

Based on the potential impact of the projected population on different spheres of development, a few recommendations have emerged as articulated below.

1. A significant threat to population and development in Rwanda is the increasing land pressure.

The country needs to put in place explicit policies to deal with the unavoidable and foreseeable population overcrowding aside from the current policies aimed at reducing the population growth.

2. The anticipated growth of urban population will exacerbate pressure on land, settlements, physical infrastructure and resources.

This will inevitably imply revisiting urban planning coupled with the requisite resources for future development of new settlements including roads, transport networks, water and electricity supply, health and educational facilities and other essential community facilities.

3. The size and growth rate of future youth and working-age populations will pose challenges in terms of generating sustainable employment and livelihood opportunities, especially in urban areas of Rwanda – this calls for essential investments in human capital development and economic reforms so that the country has a

- healthy, well educated, and highly skilled labor force that is gainfully employed as articulated in the Vision 2050.
4. The decline in fertility and improvements in adult and old age survivorship imply that the future dependency ratio is expected to be sensitive to the decreasing number of children and increasing number of elderly people in the population. Consequently, there is great need to put in place appropriate strategies towards provision of social support, health care and living arrangements of the elderly population but also retirement planning.
 5. All over the world, it is generally agreed that population projections should always be treated as provisional – given that the assumptions used might not materialize throughout the projection period. It is, therefore, recommended that regular review of the projections be undertaken when new data becomes available.

ANNEXES

Annex A: Census questionnaires

This annex provides the key pages of the Census questionnaires. The full questionnaires including all cover sheets can be obtained from the NISR.

As mentioned above, two different types of questionnaires were administered, one for private households and one for institutional households. The questionnaire for private households contained a person record, a household record and a mortality record. The questionnaire for institutional households contained only a person record.

12.beetroot	<input type="checkbox"/>	24.Other vegetables	<input type="checkbox"/>

H26: "How many tea trees does your households has?"

Ask this question if on question H24 tea tree is in selected crops

H27: How many coffee trees does your households has?

Ask this question if on question H24 Coffee tree is in selected crops

H28A: Does your household has any fruit tree?

1.Yes 2.No => Go to Section M

H28B: What Type and How many (fruit trees) does your household grow?

	28BA: Type	28BB: How many trees do you have?
1.Avocado	<input type="checkbox"/>	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
2.Orange	<input type="checkbox"/>	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
3.Papaya	<input type="checkbox"/>	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
4.Guava	<input type="checkbox"/>	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
5.Lemon	<input type="checkbox"/>	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
6.Mango	<input type="checkbox"/>	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
7.Mandarin	<input type="checkbox"/>	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
8.Jack fruits	<input type="checkbox"/>	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
9.Beefheart	<input type="checkbox"/>	<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/>
10.Passion fruits	<input type="checkbox"/>	
11.Pineapple	<input type="checkbox"/>	
12.Tree tomato	<input type="checkbox"/>	
13.Watermelon	<input type="checkbox"/>	
14.Strawberry	<input type="checkbox"/>	
15.Other fruit	<input type="checkbox"/>	

AGRICULTURAL ACTIVITIES

H23: During the last 12 months did any member of this household grow crop?

(DO NOT INCLUDE AGRICULTURAL ACTIVITIES DONE IN KITCHEN GARDEN)

1. Yes
2. NO → H28A

H23A: Where were agricultural activities done?

- 1.In household owned land
- 2.In rented land (in cash or in kind payment or for free)
- 3.In both households owned land and in rented land

H24: " What types of crops did your household grow in last 12 months?

01.Maize	<input type="checkbox"/>	12. Yams& Taro	<input type="checkbox"/>
02.Rice	<input type="checkbox"/>	13. Cooking Banana	<input type="checkbox"/>
03.Sorghum	<input type="checkbox"/>	14. Dessert Banana	<input type="checkbox"/>
04.Wheat	<input type="checkbox"/>	15. Banana for Beer	<input type="checkbox"/>
05.Bean	<input type="checkbox"/>	16. Vegetables	<input type="checkbox"/>
06.Pea	<input type="checkbox"/>	17. Tea	<input type="checkbox"/>
07.Groundnut	<input type="checkbox"/>	18. Coffee	<input type="checkbox"/>
08.Soybean	<input type="checkbox"/>	19. Sugarcane	<input type="checkbox"/>
09.Cassava	<input type="checkbox"/>	20. Pyrethrum	<input type="checkbox"/>
10.Sweet potato	<input type="checkbox"/>	21. Flowers	<input type="checkbox"/>
11.Irish potato	<input type="checkbox"/>	22. Others, specify...	<input type="checkbox"/>

SECTION M: MORTALITY									
M1: Is there any member of the household who died 12 months prior to the census night (16/08/2021-15/08/2022)? 1.Yes 2.No => End of the interview									
If there was a death in the HH during the 12 months prior to the census night ,Write their Names and ask the following questions									
S/N	M2: Names Write the names of those who died during the last 12 months	M3: SEX 1.Male 2.Female	M4: AGE at Death How old was [NAME] when (he/she) died? IF THE AGE IS 1 YEAR OR ABOVE => M5 (Record 000 if less than 1 year)	M4A:Age at death for infants How many months or days [NAME] had before dying? RECORD THE ANSWER IN MONTHS IF THE AGE WAS FROM 1 TO 11 MONTHS. RECORD THE ANSWER IN DAYS IF THE AGE WAS FROM 0 TO 29 DAYS	M5: Place of death where the death for the [NAME] took place? 1. At community 2. At health facilities	M6: Manner of Death "What is the manner of death of [NAME]? 1.Natural cause/disease 2.Accident 3.Suicide 4. Homicide 9. Don't know IF THE ANSWER IS 2-9 =>Next Person End if no other died person	If the Deceased Person was a female aged 10-49 years, we ask the following questions:		
						M7: "Did [NAME] death occur while Pregnant? 1.Yes => Next Person 2.No	M8: "Did the death Occur during the childbirth? 1.Yes =>Next Person 2.No	M9: "Did the death occur during the 6 weeks' period following the termination of pregnancy? 1: Yes =>Next Person 2: No=>Next Person =>Next Person End if no other died person	
1	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> 1:days <input type="checkbox"/> 2:months	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> 1:days <input type="checkbox"/> 2:months	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/> 1:days <input type="checkbox"/> 2:months	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

GENERAL POPULATION AND HOUSING CENSUS
16 – 30 AUGUST 2022

Legal Basis: Law n° 45/2013 of 16/06/2013 on the organisation of statistical activities in Rwanda.

CENSUS QUESTIONNAIRE (INSTITUTIONAL HOUSEHOLD)

SECTION IL: LOCALISATION AND IDENTIFICATION OF INSTITUTIONAL HOUSEHOLD

IL01. PROVINCE/KIGALI CITY : |

IL02. DISTRICT: |

IL03. SECTOR: |

IL04. CELL: |

IL05. VILLAGE: |

IL06. ENUMERATION AREA (NO EA) : |

IL07. AREA OF RESIDENCE(1.URBAN 2.RURAL) : |

IL08. BUILDING NUMBER: |

IL09. INSTITUTIONAL HOUSEHOLD NUMBER: |

IL10. FOOT PRINT NUMBER (as it is shown on the map) : |

IL11. GPS COORDINATES: Latitude: | | | | | |
Longitude: | | | | | |

IL12. DISTANCE: |

IL13. HOUSEHOLD TYPE: 1. Private HH
2. Institutional |

IL13A. ENUMERATION GROUP NUMBER |

My names is I work for the National Institute of Statistics of Rwanda as the enumerator of the General Population and housing census. The objective of the general population census is to have the full enumeration of all Rwandan residents as well as their key characteristics; for the planning of the well-being of Rwandan residents. I wish to have an interview that will last 10 min with you. All provided answers will be kept confidential. I hope that you accept the interview as your responses are very important for the country.

IL14 CONSENT: 1. Interview accepted =>P01A
2. Interview is not done |

THE REASON OF NO INTERVIEW: 1. Uninhabited dwelling
2. Dwelling turned into business building
3. Dwelling destroyed
4. Refused |
5. All residents are absents during the whole period of enumeration |

SECTION P: CHARACTERISTICS OF THE POPULATION	
FOR ALL RESIDENT IN THE INSTITUTIONAL HOUSEHOLD	
P01A: Serial Number of the person	<input type="text"/>
P01B: Surname of the person:	
P01C: Other names of the Person:	
P03 : What is [NAME]'s Sex? 1.Male 2.Female	<input type="checkbox"/> <input checked="" type="checkbox"/>
P04: How old was [NAME] at his/her Last Birthday? Note: Record age in completed years	<input type="text"/>
P05A: In which month [NAME] was born?	<input type="text"/>
P05B: In which year [NAME] was born? Note: RECORD 9999, IF THE YEAR IS UNKNOWN	<input type="text"/>
P06: What is [NAME]'s marital status? ALL RESIDENTS AGED 12 YEARS AND ABOVE	<p>1.Married to one wife/husband officially 2.Married to one wife/husband not officially 3.Live in a polygamous union 4.Divorced 5.Separated 6.Never married 7.Widowed</p>
P07A Is [NAME] usual resident or was a visitor on census night? 1.Usual resident 2. Visitor => GO TO NEXT PERSON	<input type="checkbox"/>
P07B: Did [NAME] sleep in this household on census night? 1. Yes, slept in this HH (PR) 2. No, did not sleep in this HH (AR)	<input type="checkbox"/>
P09A Was [NAME] born in Rwanda or Abroad? 1. Rwanda 2. Abroad =>P09C	<input type="checkbox"/>
P09B: In which District [NAME] was born? => P10A (SELECT ONE DISTRICT FROM THE LIST OF ALL DISTRICT)	<input type="text"/>
P09C: In which Country [NAME] was born? (SELECT ONE COUNTRY FROM WORLD COUNTRIES LIST)	
P10A: How many years has [NAME] been living continuously in [District]? - RECORD 0 IF LESS THAN 1 YEAR - RECORD 888 IF THE RESIDENCE HAS NOT CHANGED SINCE BIRTH - IF THE RESIDENCE HAS NOT CHANGED SINCE BIRTH =>P12B	<input type="text"/>
P10B: Prior to come living in [district], was [NAME] residing in Rwanda or abroad? 1.Rwanda 2.Foreign Country =>P11B	<input type="checkbox"/>
P11A: In which District [NAME] was residing prior to come living Here? =>P12B (SELECT THE DISTRICT FROM THE LIST)	<input type="text"/>
P11B: In which Country [NAME] was residing previously? (SELECT ONE COUNTRY FROM OF WORLD COUNTRIES LIST)	
DISABILITY: FOR RESIDENT AGED 5 YEARS AND ABOVE	
CHOOSE THE NATIONALITY FROM WORLD COUNTRIES LIST	
P12B: What is [NAME]'s Nationality ?	<input type="text"/>
P13 What is [NAME]'s Religious affiliation?	
<p>01.Catholic 02.Protestant /Pentecost 03. Adventist 04. Other Christians 05.Muslim 06. Jehovah witness 07. Traditional/Animist 08. Other religion 09. No Religion 10. Not stated 99.Do not know</p>	
P14: What is [NAME]'s Medical insurance?	<p>1.Mutuelle 5. Employer 2.RSSB (Ex: RAMA) 6. Private insurance companies 3.MMI 7. NGOs 4.Schools 8. None 9. Do not know</p>
DISABILITY: FOR RESIDENT AGED 5 YEARS AND ABOVE	
P15A: Does [NAME] have difficulty seeing? 1.Yes 2. No => P16A	
P15AA: Does [NAME] wear glasses? 1.Yes 2. No => P15B	
P15AB: Does [NAME] continue to have difficulties even when wearing glasses? 1.Yes 2. No => P16A	
P15B: Would you say [NAME] has some difficulty seeing, a lot of difficulty or cannot do at all? 0. No, no difficulty 1.Yes – some difficulty 2.Yes – a lot of difficulty 3.Cannot see at all	<input type="checkbox"/>
P16A: Does [NAME] have difficulty hearing ? 1.Yes 2. No => P17A	
P16AA: Does [NAME] use hearing aid? 1.Yes 2. No => P16B	
P16AB: Does [NAME] continue to have hearing difficulties even if using hearing aid? 1. Yes 2. No => P17A	
P16B: Would you say [NAME] has some hearing difficulty, a lot of difficulty or Cannot do at all? 0. No, No difficulty 1.Yes – some difficulty 2.Yes – a lot of difficulty 3.Cannot hear at all	<input type="checkbox"/>
EDUCATION: ALL HOUSEHOLD RESIDENTS	

SECTION P: CHARACTERISTICS OF THE POPULATION	
<p>P17A: Does [NAME] have difficulty walking or climbing steps?</p> <p>1.Yes <input type="checkbox"/></p> <p>2. No => P18A</p> <p>P17B: Would you say some difficulty, a lot of difficulty or Cannot do at all?</p> <p>0. No, No difficulty 1.Yes – some difficulty <input type="checkbox"/></p> <p>2. Yes – a lot of difficulty 3. Cannot walk or climb steps at all <input type="checkbox"/></p> <p>P18A: Using his/her usual (customary) language, does [NAME] have difficulty communicating, for example being understood?</p> <p>1. Yes <input type="checkbox"/></p> <p>2. No => P19A</p> <p>P18B: Would you say some difficulty, a lot of difficulty or Cannot do at all?</p> <p>0. No, No difficulty 1.Yes – some difficulty <input type="checkbox"/></p> <p>2. Yes – a lot of difficulty 3. Cannot communicate at all <input type="checkbox"/></p> <p>P19A: Does [NAME] has difficulty remembering or concentrating?</p> <p>1. Yes <input type="checkbox"/></p> <p>2. No => P20A</p> <p>P19B: Would you say some difficulty, a lot of difficulty or Cannot do at all?</p> <p>0. No difficulty 1. Yes – some difficulty <input type="checkbox"/></p> <p>2. Yes – a lot of difficulty 3. Cannot do at all <input type="checkbox"/></p> <p>P20A: Does [NAME] have difficulty with self-care such as washing all over or dressing?</p> <p>1. Yes <input type="checkbox"/></p> <p>2. No => P21A</p> <p>P20B: Would you say some difficulty, a lot of difficulty or Cannot do at all?</p> <p>0. No, no difficulty <input type="checkbox"/></p> <p>1. Yes – some difficulty <input type="checkbox"/></p> <p>2. Yes – a lot of difficulty <input type="checkbox"/></p> <p>3. Cannot do at all <input type="checkbox"/></p> <p>P21A: Does [NAME] have a short stature?</p> <p>1. Yes <input type="checkbox"/></p> <p>2. No <input type="checkbox"/></p> <p>P22A: Does [NAME] have a problem with albinism?</p> <p>1. Yes <input type="checkbox"/></p> <p>2. No <input type="checkbox"/></p> <p>P29: Has [NAME] ever attended or is currently attending school /ECD?</p> <p>1. Has ever attended <input type="checkbox"/></p> <p>2. Is currently attending <input type="checkbox"/></p> <p>3. Has never attended =>P32</p>	<p>P30A: What is the highest level of education did [NAME] attend or is currently attending?</p> <p>1.ECD =>P32</p> <p>2.Nursery <input type="checkbox"/></p> <p>3.Primary <input type="checkbox"/></p> <p>4.INGOBOKA /Vocational training <input type="checkbox"/></p> <p>5. Lower secondary <input type="checkbox"/></p> <p>6. Upper secondary <input type="checkbox"/></p> <p>7. Tertiary <input type="checkbox"/></p> <p>P30B: How many years of school did [NAME] complete successfully at that level? WRITTE 99 IF THE NUMBER OF COMPLETED YEARS IS UNKNOWN <input type="checkbox"/></p> <p>P31: What is the highest certificate/degree [NAME] obtained?</p> <p>1. Primary school certificate</p> <p>2. Post primary certificate (CE/FM/TVET I/TVET II)</p> <p>3. EMA/ENTA</p> <p>4. O'level Certificate</p> <p>5. A3/D4/D5</p> <p>6. A2/D6/D7</p> <p>7. TVET certificate III</p> <p>8. TVET certificate IV</p> <p>9. TVET certificate V</p> <p>10. TVET advanced diploma (A1)</p> <p>11. Diploma(A1): D6+2-3yrs</p> <p>12. Bachelor(A0): D6+3-6yrs</p> <p>13. Post Graduate Diploma</p> <p>14. Masters: Bachelor+1-2yrs</p> <p>15. Doctorate (PhD)</p> <p>16. None 99. Do not know <input type="checkbox"/></p> <p>QUESTIONS (P32-P36C) ARE RESERVED FOR PERSONS AGED 10 YEARS OLD AND ABOVE</p> <p>P32: Can [NAME] read, write and understand the following languages?</p> <p>MORE THAN ONE LANGUAGE IS ALLOWED READ MODALITIES STARTING BY KINYARWANDA</p> <p>1. Kinyarwanda <input type="checkbox"/> 8. Swahili <input type="checkbox"/></p> <p>2. English <input type="checkbox"/> 16. Other <input type="checkbox"/></p> <p>4. French <input type="checkbox"/> 0. None <input type="checkbox"/></p> <p>P33: Has [NAME] ever attended or currently attending Informal adult literacy Program? (RESERVED FOR THOSE WHO ANSWERED P29=3 OR P30A<4 AND P30B<4)</p> <p>1. Yes, Still Attending <input type="checkbox"/></p> <p>2. Yes, Completed <input type="checkbox"/></p> <p>3. Never attended <input type="checkbox"/></p>
EDUCATION: ALL HOUSEHOLD RESIDENTS	FOR RESIDENT WOMEN AGED 10 YEARS AND ABOVE

SECTION P: CHARACTERISTICS OF THE POPULATION	
	NOT APPLICABLE FOR RELIGIOUS ORGANISATIONS
P34: Did [NAME] use internet in the last 12 months? NOT TO BE ASKED FOR PRISONS 1.Yes 2.No =>P36A 9. Do not know=>P36A	P50A: Has [NAME] ever given a live birth? 1.Yes 2.No => Next Person
P35: Where does [NAME] often access Internet? 1.From Home 2.From work place 3.From School/Place of Education 4.From Another Person's home 5.From Community Internet access facility 6.From cyber café/From Commercial Internet Access facility 7.Other	P50B_Boys: How many live boys has [NAME] ever had? <input type="text"/> P50B_Girls: How many live girls has [NAME] ever had? <input type="text"/>
	P50C_Boys: Among those boys how many are still alive? TO BE ASKED IF P50B_BOYS>0 <input type="text"/> P50C_Girls: Among those girls how many are still alive? TO BE ASKED IF P50B_GIRLS>0 <input type="text"/>
P36A: Does [NAME] own a mobile phone? 1. Yes 2. No => P50A IF SHE IS A FEMALE AGED 10YEARS AND ABOVE. OTHERWISE GO TO NEXT PERSON NOT TO BE ASKED FOR PRISONS	P51A: During the 12 months prior to the census night (From 16/08/2021- 15/08/2022) Did [NAME] give a live birth? 1.Yes 2.No => Next Person
P36 C: What type of mobile phone does [NAME] have? 1.Smart phone 2.Ordinary phone with radio 3.Ordinary phone without radio IF ONE OWNS BOTH TYPES CHOOSE SMART PHONE	P51B_Boys: How many live boys did [NAME] have during the 12 Months prior to the census night (From 16/08/2021-15/08/2022)? <input type="text"/> P51B_Girls: How many live girls did [NAME] have during the 12 Months prior to the census night (From 16/08/2021-15/08/2022)? <input type="text"/>
	P51C_Boys: Among those boys how many are still alive? TO BE ASKED IF P51B_BOYS>0 <input type="text"/> P51C_Girls: Among those girls how many are still alive? TO BE ASKED IF P51B_GIRLS>0 <input type="text"/> => GO TO NEXT PERSON

Annex B: Supplementary tables

Annex Table 1. Projection of the total population by single age, 2023-2052 - High projection scenario

Single age	2023			2024			2025			2026			2027

Annex C: Persons and institutions that contributed to the fifth Rwanda Population and Housing Census, 2022

National Census Task Force

Institutions

- Office of the President of the Republic of Rwanda
- Office of the Prime Minister
- Ministry of Finance and Economic Planning
- Ministry of Local Government
- Ministry of Defence
- Ministry of Interior
- Ministry of Health
- Ministry in Charge of Emergency Management
- Ministry of Foreign Affairs and Cooperation
- Ministry of Education
- Ministry of ICT & Innovation
- Ministry of Public Service and Labour
- Ministry of Infrastructure
- Rwanda Information Society Authority
- Office of Government Spokesperson
- Rwanda National Police
- Rwanda Correctional Service
- Rwanda Public Procurement Authority
- Rwanda Utilities Regulatory Authority
- Rwanda Broadcasting Agency
- Rwanda Education Board
- National Examination and School Inspection Authority
- Rwanda Biomedical Centre
- Representatives of all Religious Confessions

Branches of the National Census Task Force

Members of the task Force at Province and the City of Kigali

- Office of the Lord Mayor, City of Kigali
- Office of the Governor, Southern Province
- Office of the Governor, Western Province
- Office of the Governor, Northern Province
- Office of the Governor, Eastern Province
- Representatives of all Religious Confessions

Members of the Branches of the Census Task Force at District Level

- Office of the District of Nyarugenge
