FOREWORD

Since 2012, the National Institute of Statistics of Rwanda (NISR), in partnership with the Ministry of Agriculture and Animal Resources (MINAGRI), National Agriculture Export Board (NAEB), and the Rwanda Agricultural Board (RAB), has been conducting the annual agricultural survey. The study aims at estimating the national crop production, cultivated and harvested area, crop yield, agricultural inputs, and practices crucial for monitoring progress on agriculture programs and policies in Rwanda.

This published report reflects the importance of the Seasonal Agricultural Survey (SAS) information for use as a tool to assist in addressing key agricultural issues and information needs that will inform policymakers and other stakeholders and allow more effective identification of priority intervention needs.

Therefore, I recommend stakeholders, government, researchers, partners, and the general public to optimally make use of the findings of this report.

I am grateful to NISR staff and other partners who worked tirelessly to ensure the 2021 Seasonal agricultural survey was successfully implemented.

Yusuf MURANGWA
Director General, NISR

EXECUTIVE SUMMARY

In the agricultural year 2020/2021, the National Institute of Statistics of Rwanda (NISR) conducted the Seasonal Agriculture Survey (SAS) covering three usual agricultural seasons. The main agricultural seasons in Rwanda are Season A which starts from September to February of the following year and Season B which starts from March to June. Season C is the shortest agricultural season with vegetables and sweet potato predominantly grown in swamps and Irish potato mostly grown in the volcanic agro-ecological zone. This report, therefore, consolidates the findings of all seasons and hence, highlights the findings mainly related to:

1. Land use:
 - Agricultural land: this indicates land potential for agriculture, including land currently being used for farming as well as land that can be brought back into cultivation (fallow or pastureland).
 - Arable land: land able to be grown and produce crops for food and feeds supply purpose. This area excludes land under permanent crops¹ and permanent pasture.
 - Physical crop cultivated area: area occupied by crops. In other words, it can be called cropland;
 - Pastureland: area under natural grasses reserved for livestock or occupied with fodder crops;
 - Fallow land: cultivable land free for cultivation in a temporal period (less than 5 years);
2. Crop land: Cultivated land devoted to each grown crop.
3. Crop production: Amount of harvested crop used for food or livestock (quantified into kilograms or tons.)
4. Crop yield: It is a measurement of the amount of crop harvested per unit of land area (kg per hectare). It is used to determine the efficiency of food production.
5. Use of inputs (this assesses the use of improved seeds, fertilizers and pesticides)
6. Agricultural practices (practice of irrigation and soil protected against erosion) and others.

Estimates for major crops are prepared mainly to give timely and current district and national totals and averages. They are based on data obtained by a sample of surveyed small-scale plots and large-scale farmers. Survey data are supplemented by tea and coffee data from National Agriculture Export Board (NAEB) collected through the routine activities of monitoring coffee and tea production, and coffee census conducted every five years.

Land use

Results of SAS 2021 estimate the total country land area is estimated at 2.377 million of hectares for which 1.43 million hectares (60% of total country land) is used for agriculture. Out of the total agricultural land, 1.1 million hectares was used for Seasonal crops in season A, nearly 0.6 million hectares are area under permanent crops, while 0.131 million ha under permanent pasture.

¹ Permanent crops are crops produced from plants which last for many seasons, rather than being replanted after each harvest. Those crops are fruit trees, sugar cane, coffee, tea, banana, tree plantations, nuts trees...).

Likewise, season B estimate the total country land at 2.377 million hectares of which 1.395 million hectares (56.4% of total country land) are used for agriculture. Out of the total agricultural land, 1 million hectares was used for seasonal crops in season B, nearly 0.6 million hectares are area under permanent crops, while 0.132 million hectares were used for permanent pasture.

Crop area

The overall crop area for the year 2020/2021 has remained unchanged compared to the previous year.

Use of inputs

In 2021, SAS results show that 37.1 percent of farmers used improved seed in season A compared to 17.2 percent in season B and 23.8 percent in season C. In regards to fertilisers, 67 percent of farmers applied organic fertilisers in season A compared to 56.3 percent in season B and around 74 percent in season C, while 40.9 percent applied inorganic fertilizers in season A against 32.7 percent in season B and 68.3 percent in season C. Moreover, 22.4 percent of farmers used pesticides during pest control activities in their farms in season A against 17.9 percent in season B and 65.6 percent in season C.

Agricultural practices

The findings show that nearly 90% of interviewed farmers protected the cultivated land against erosion throughout the year. Farmers practiced irrigation in seasons A, B, and C with 9.2 percent, 8.3 percent and 59.1 percent respectively, while about 38% of interviewed farmers practiced agroforestry for both main seasons A and B. Table 0 enclosed the main indicators covered during the SAS 2021 are summarized hereunder in table 0

I. INTRODUCTION

Agriculture continues to be one of the most important pillars of economic growth for Rwanda, and a much emphasis for agriculture transformation has been underpinned under the new national development strategy. In recognition of its potential in economic development, food security and poverty reduction, the government has set an ambitious agricultural agenda under the new strategy for transformation of agriculture (PSTA 4) aiming at transformation of Rwandan agriculture from a sector characterised by low productivity to a sector using knowledge to increase productivity and investing in value addition and commercialization.

Quality agriculture statistics are useful in evaluating the performance of national agricultural programs and hence, imperative for evidence-based decision making. While the use of statistics in decision-making processes continues to grow, the demand for agriculture data is also increasing. In this regard, the National Institute of Statistics of Rwanda (NISR) in collaboration with the Ministry of Agriculture and Animal Resource (MINAGRI) conducts the Seasonal Agricultural Survey (SAS) to gather various agriculture information mainly related to potential agricultural land use; crop area, yield and production; agricultural inputs, agricultural practices as well as other agricultural items.

The survey data are supplemented by administrative records on tea and coffee from the National Agriculture Export Board (NAEB). These data are collected through routine activities during monitoring of coffee and tea production. Other agriculture related information including total of quantity of agricultural inputs used, total agricultural exports, crop varieties grown, crop intensification program among others is obtained from MINAGRI working closely with Rwanda Agriculture Board (RAB), district agronomists, and other partners working in the agriculture sector.

The NISR has steered the Seasonal Agriculture Survey covered three main agricultural seasons A, B and C. Season A (September to February of the following year), season B (March to June) while season C is a shorter season mainly for vegetables and sweet potato grown in swamps and Irish potato grown in the volcanic agro-ecological zone.

1.1.Objective of the Survey

The main objective of SAS is to provide timely, accurate, reliable and comprehensive agricultural statistics that describe the structure of agriculture in Rwanda mainly in terms of land use, crop area, yield and crop production to monitor current agricultural and food supply conditions and to facilitate evidence-based decision making for the development of the agricultural sector.

Therefore, this report presents thoroughly the findings of 2021 Seasonal Agricultural Survey in relation to:

1. Land use:
 - Agricultural land: this includes land under farming and land that can be taken back into cultivation (fallow or pastureland). Agricultural land indicates the potential land for agriculture.
 - Arable land: land able to be grown and produce crops for food and feeds supply purpose. This area of land excludes land under permanent crops and permanent pasture.
 - Physical crop cultivated area: this is the area of land occupied by crops.
 - Pastureland: area under natural grasses reserved for livestock or occupied by fodder crops;
 - Fallow land: cultivable land free for cultivation in a temporal period (less than 5 years);
2. Crop land: Cultivated land devoted to any grown crop
3. Crop production: Quantity of harvested crop produce used for food/livestock (kilograms or tons)
4. Crop yield: It is a measurement of the quantity of crop harvested per unit of land area (kg per hectare). It is used to determine the efficiency of food production at a certain period.
5. Use of inputs (this assesses the level of use of improved seeds, fertilizers, pesticides and other soil remedies)
6. Agricultural practices (practices of irrigation and erosion control measures) and others.

II. SURVEY DESIGN

2.1. Sample frame design

The SAS uses a Multiple-Frame Sampling (MFS) methodology providing the basis for conducting probability surveys. This approach is mainly based on complete coverage of the area and enables to avail agricultural data with precise survey estimates. The methodology encompasses two sample frames:

- the area frame from which the main survey sample is drawn; and
- a list frame of large-scale farmers (LSF) to complement the area frame, with the aim to cover crops mostly grown by large scale farmers which are not easily covered in the area frame. For a farmer to be considered “large-scale”, he/she should have at least 10 hectares of agricultural holdings operated in the same district.

The process of area frame construction is a three-pronged process involving the following steps: land cover classification, land stratification and sampling of segment.

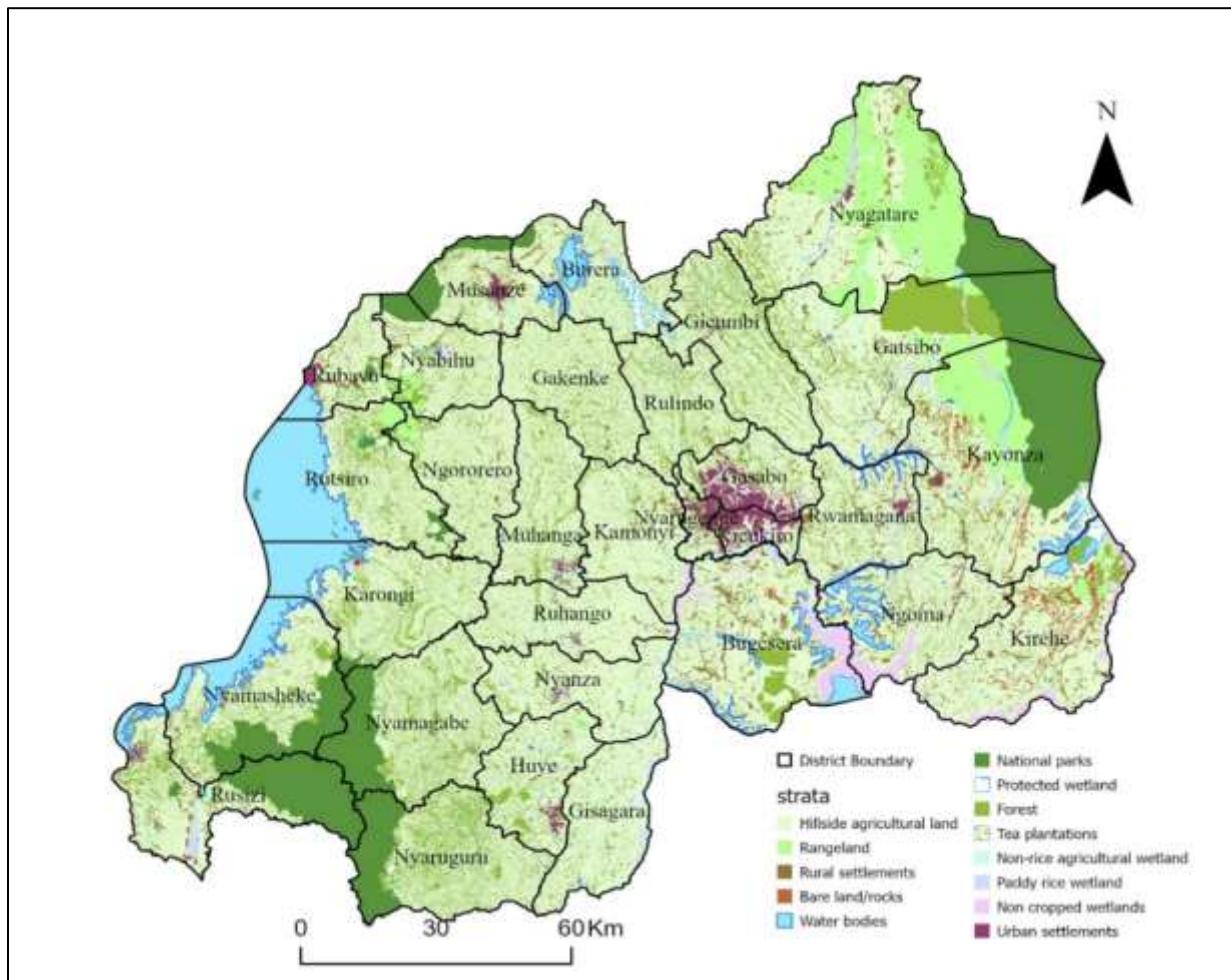

2.1.1. Land classification

Land classification was done using Rwanda land cover map combining different geographical layers available in the country, plus a photo interpretation of a series (2010 to 2019) of high-resolution satellite images from Worldview. As a result, the Rwanda land cover map has been divided into 13 land cover classes (as shown in Table 1).

Table 1: List of Rwanda land cover classes

Code	Land cover class name	Area (Ha)	Percentage share
1.0	Consolidated tea plantations	17,821	0.7
1.1	Hillside agricultural land	1,343,933	53.1
2.1	Non-rice agricultural wetland	55,807	2.2
2.2	Paddy rice wetland	21,848	0.9
2.3	Non cropped wetlands	37,743	1.5
3.0	Rangeland	144,490	5.7
4.1	Urban settlements	31,612	1.2
4.2	Rural settlements	78,928	3.1
5.0	Bare land/rocks	15,404	0.6
6.0	Water bodies	135,295	5.3
7.0	National parks	241,455	9.5
8.0	Protected wetland	12,201	0.5
9.0	Forest plantations	395,001	15.6

Source: NISR, SAS, 2021

Map 1: Rwanda land classification map

Source: NISR, SAS 2021

Among 13 land cover classes, some of them are related to agricultural activities. The next step of building the area sample frame was to group land cover classes into strata in order to identify agricultural strata to be considered in sample frame.

2.1.2. Stratification

Out of 13 land cover classes, 5 are considered for the agricultural survey frame. These classes are tea plantation, hillside agricultural land, non-rice agricultural land, paddy rice agricultural wetland, and rural settlement (potential for agricultural production of kitchen gardens crops, fruit trees, and livestock). The remaining land cover classes are considered as excluded from the frame of potential land for agriculture. The sampling frame is made of a set of square clusters(segments) of 9 hectares each covering the whole country. By overlapping the clusters layer with land cover classes layer, each cluster was assigned a dominant land cover class as a stratum definition, basing on a defined threshold as follow:

Table 2. List of strata

Stratum	Stratum name	Definition
1.0	Dominant hill crop land stratum	Clusters with Hillside agricultural land cover class greater or equal to 60 percent of the total area of the cluster
2.0	Dominant Wetland crops stratum	Clusters with non-rice wetland land cover class greater than 25 percent of total area of the cluster
3.0	Dominant rangeland	Clusters with rangeland land cover class greater or equal to 60 percent of the total area of the cluster
4.0	Mixed stratum	The rest of other possible combinations
9.0	Excluded stratum	All clusters with excluded land cover classes greater or equal to 50 percent of the total area of the cluster

Source: NISR, SAS, 2021

In addition, tea plantation class data which are recorded by the National Agriculture Export Board and large-scale farms which are completely enumerated during the Seasonal Agricultural Survey, were not considered in the agricultural strata taken in sample frame. This means that only dominant hill crop land stratum, dominant wetland crops stratum, dominant rangeland stratum and mixed stratum were considered as area frame from which a sample segment was selected.

Table 3. Population size per district by stratum (number of segments)

National	148,119	7,508	15,494	23,433	75,435	269,989

2.1.3. Sampling procedures

Out of 5 defined agricultural strata, only dominant hill crop land stratum, dominant wetland crops stratum, dominant rangeland stratum and mixed stratum were considered as land potential for agriculture. The remaining stratum is the non-agricultural land. Note that clusters covered by tea plantations were not considered in the area sample frame due to reasons stated above. Thus, SAS is conducted on 4 above mentioned strata to cover other major crops.

In 2021 agricultural year, the total sample used was 1200 segments. At first stage, 1200 segments were selected and allocated at district level based on the power allocation approach (Bankier², 1988). Sampled segments inside each district were distributed among strata with a proportional-to-area criterion.

Table 4: Allocation of sampled segments per district by stratum

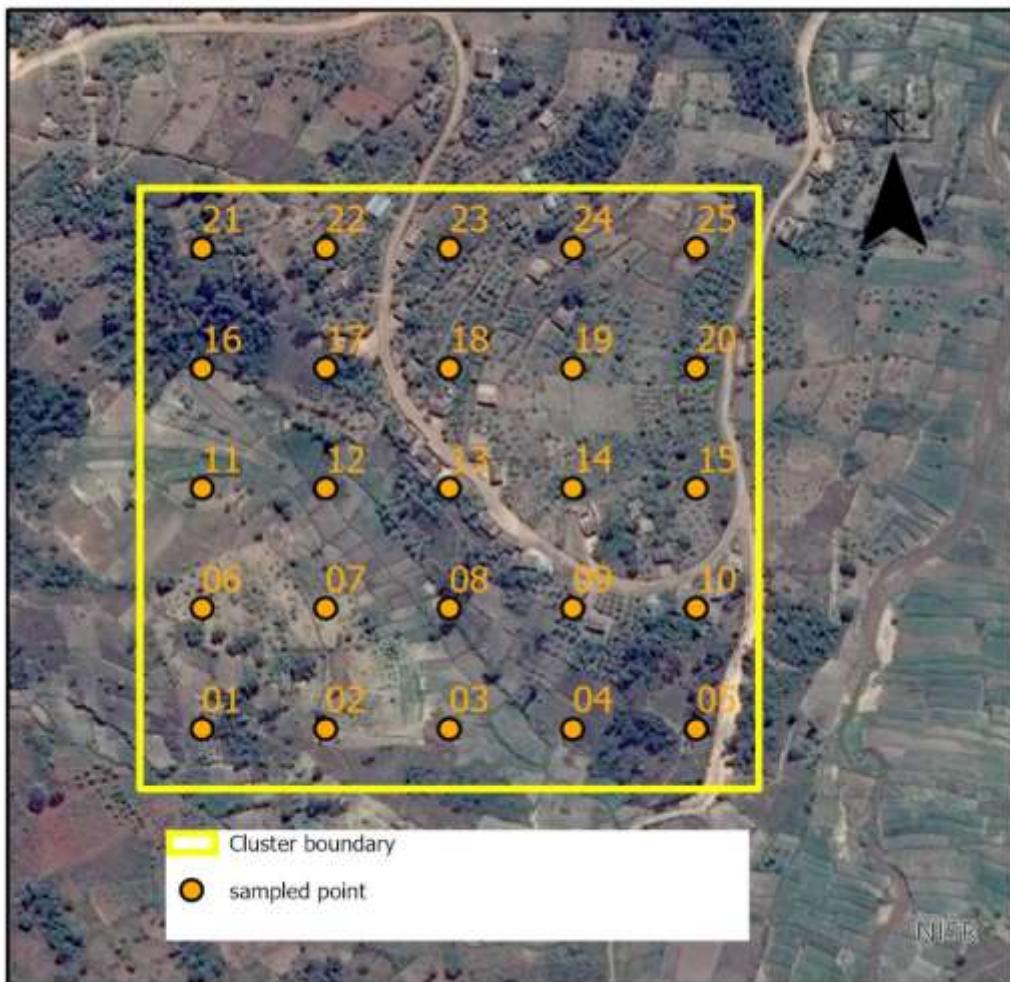

District	Stratum					Total A & B	Season C
	Dominant hill crop land	Dominant wetland crops	Dominant rangeland	Mixed stratum			
Nyarugenge	12	6	-	2	20	10

² Bankier M.D. (1988) Power allocations: determining sample sizes for subnational areas. *The American Statistician*, Vol. 42, n. 3 pp. 174-177.

At second stage, 25 sample points were systematically selected, following a special distance of 60 meters between points. Sample points are reporting units within each segment, where enumerators go to every point, locate and delineate plots in which the sample points fall, and collect records of land use and related information. The recorded information represents the characteristics of the whole segment which are extrapolated to the stratum level and hence the combination of strata within each district provides district area related statistics.

Map 2: Map showing square cluster(segment) with 25 sampled points

Source: NISR, SAS, 2021

2.1.4. Weighting Procedures

Based on the stratified two-stage sample design used with the new area frame, the first stage sampling probability for the sample segments in each stratum is calculated as:

$$p_{1h} = \frac{n_h}{N_h}$$

where:

p_{1h} = probability of selection of sample segments in stratum h (district by stratum)

n_h = number of sample segments selected in stratum h

N_h = Total number of segments in the area frame for stratum h in each stratum

The second stage probability was calculated at the plot level based on the assumption that the plots within each sample segment were implicitly selected with PPS using the area of the plot as the measure of size. Therefore, the second stage probability of selection can be expressed as follows:

$$p_{2hi} = \frac{g_{hi} \times A_{hi}}{A_{hi} \times g_{hij}}$$

Where:

p_{2h} = Probability of selection of the plot in segment h

g_{hi} = Number of grid squares selected in the i-th sample segment of stratum h;

A_{hij} = Area of the j-th sample plot selected in the i-th sample segment of stratum h

A_{hi} = Area of the i-th sample segment of stratum h;

g_{hij} = Number of selected grid squares in the j-th sample plot of the i-th sample segment of stratum h

The weight of a sample plot is equal to the inverse of the first and second stage probabilities of selection:

$$W_{Phij} = \frac{1}{p_{1h} \times p_{2hi}} = \frac{N_h \times A_{hi} \times g_{hij}}{n_h \times g_{hi} \times A_{hij}}$$

Where:

W_{Phij} = weight for the j-th sample plot in the i-th sample segment in stratum h

2.2.Data Collection design

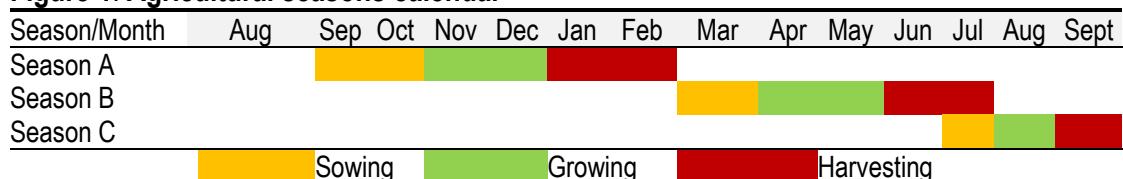

During the SAS 2021 exercise, data collection covered three main agricultural seasons A, B and C and was conducted into two separate phases in each season: the first phase, known as screening activity (post-planting phase), consists of visiting all sampled segments and demarcating all plots with sampled points with the aim of covering the information related to land area, planted crops and land use. While the second phase involves capturing of production data by visiting sampled agricultural plots identified from screening activity as well as all Large-Scale Farmers (LSF). To ensure the smooth completion of the SAS workload, NISR employed 128 Enumerators, 29 Team Leaders and 3 Editors. All fieldwork staff hold a degree in agriculture sciences and were consistently trained by NISR headquarter staff before starting data collection in each season. Moreover, a higher-level supervision was organised and done by staff from NISR who frequently visited the field teams during each phase of data collection in order to ensure the quality of collected data.

2.2.1. SAS timeframe and agricultural seasons in Rwanda

The Seasonal Agriculture Survey (SAS) data collection was conducted following the three ordinary agricultural seasons. The SAS field activities were carried out during the regular seasons' calendar that covers the approximate monthly periods as follows:

- Season A started in September 2020 and ended with February 2021
- Season B started in March 2021 and ended with June 2021; while
- Season C that starts in July and ends in September 2021, it is a short agricultural season with vegetables and sweet potato predominantly grown in marshlands, whereas Irish potato are grown in volcanic agro-ecological zone.

Figure 1: Agricultural seasons calendar

Source: NISR, SAS, 2021

Specifically, During the 2021 SAS, the field work for season A covered the period from 2nd December 2020 to 4th February 2021 while season B data collection was conducted from 2nd May to 30th June 2021. In both cases, data collection was carried out in 1,200 segments and 330 large scale farmers' holdings across the country. During the farmer's interviews, the survey covered 13,807 small scale farmers and 330 large scale farmers for both seasons A and B. Besides, the data collection was carried out in 843 sites potential to grow season C crops in addition to 1200 segments and covered the period from 15th August to 8th September 2021. For annual and perennial crops, the production estimates are covered for 6 months considering these harvested behaviours.

Data collection tools and materials

Seasonal Agricultural Survey used two questionnaires:

- **Screening Questionnaire:** Screening questionnaire is used to collect information on the delineated plot. This information is mainly related to land use, plot area and crop cultivated.
- **Plot Questionnaire:** Plot questionnaire is used to collect information mainly related to crop production, inputs used (seeds, fertilizers and pesticides), and agricultural practices in the sampled plots.

The computer assisted personal interview (CAPI) data collection methodology was used during the SAS exercise and it mainly comprises three different software applications:

- **Collector:** which is GIS based application, is used to identify and navigate the enumerator team to the exact GPS sample-point location and for mapping the plot boundary for GIS area determination,
- **Survey 123:** which is GIS based application, used to collect screening data for Large-scale farmers.
- **CS Entry application,** which is a CSPro data entry application used on Android tablets to collect data for interview of plot questionnaire.

In addition, each enumerator and team leader had adequate materials composed of enumerator's instruction manual, android tablet, charger, Power banks, pens, notebooks, pencils, calculator, weighing scales, Global Positioning System (GPS), boots, etc. Teams were given vehicles for transport facilitation.

2.2.2. Field data collection procedures

Before proceeding to the field, enumerators and their team leaders must check if they have required materials for their fieldwork. Filed workers use Explorer software to direct them to sampled segment. Data are collected as follows:

- **Screening Activity of the Segment:** Arriving at the segment, field workers use GPS to direct them to the sampled point inside the segment. Arriving at the point, enumerators identify plot boundary with the guide of the farmer and delineate the plot using collector with external GPS connected to the tablet. For large scale farmers, complete enumeration of plots with at least 10 hectares is done.
- **Farm Interview:** After screening activity, only agricultural plots are given to enumerators to collect information provided in the plot questionnaire.

2.3. Data processing and analysis

CAPI data collection method allows enumerators to collect and enter data using tablets and send those data to the server at headquarter where data are received by NISR staff, checked for consistency and thereafter transmitted to analysts for tabulation using STATA.

2.4. Concepts, definitions and estimation methods

1. Total land area

Total land area at district level is the district area excluding area under inland water bodies. The definition of inland water bodies generally includes major rivers and lakes.

2. Agricultural area

Agricultural area includes arable land, land under permanent crops and permanent pasture.

3. Arable land

Arable land includes land defined by the FAO as land under temporary crops (double-cropped areas are counted only once), temporary meadows for mowing or pasture, land under market and kitchen gardens and land temporarily fallow (less than five years).

The abandoned land resulting from shifting cultivation is not included in this category. Data for arable land are not meant to indicate the amount of land that is potentially cultivable.

4. Permanent crop land

Permanent crops are sown or planted once and occupy the land for some years and do not need to be replanted after each annual harvest, such as cocoa, coffee and rubber. This category includes flowering shrubs, fruit trees, nut trees and vines, but excludes trees grown for wood or timber. The following crops are considered as permanent crops in SAS: Cooking banana, Dessert banana, Banana for beer, Avocado, Coffee, Sugar cane, Macadamia, Olive, Mango, Apple, Papaya, Orange, Lemon, Guava, Mulberry, Stevia, Jatropha, Palm, and Tea.

5. Permanent pastureland

Land used permanently (five years or more) for herbaceous forage crops, either cultivated or growing wild (wild prairie or grazing land).

6. Irrigated agricultural land

Area equipped for irrigation, which is actually irrigated, (sometimes expressed as a percentage of the total land area). Part of the area equipped for irrigation refers to area equipped to provide water to crops and includes areas equipped for full/partial control irrigation, equipped lowland areas, and areas equipped for spate irrigation. Part of the area equipped for irrigation which is actually irrigated refers to physical areas. Irrigated land that is cultivated more than once a year is counted only once.

7. Physical area

Physical area refers to the total area of the plot as physically measured. The physical agricultural area in a district is estimated by aggregating all weighted individual agricultural plots area for that district.

8. Crop area (cultivated area)

Crop area refers to the area occupied by a given crop in a plot considering its density or occupation. In context of Rwanda as well as many African countries, mixed cropping system is a general practice in agriculture.

This practice makes it complex to estimate area under crop cultivation. In case of pure stands (for crop completely covering a plot), crop area is equal or less to physical plot area (if a crop is partially covering the plot, the share is estimated then applied to the plot area). In case of mixed crops, the share of each crop in the plot is estimated by enumerator by eye estimation method and applied to the physical area of the plot to obtain area for each specific crop planted in plot. In this context, the crop share is eye estimation of crop density or occupation in a plot (in %) basing on spacing between plants. Cultivated area at district level is equal to the total weighted crop areas within plots in the whole district.

Examples

- In case of pure stands, crop area will be equal to the physical area if the crop entirely covers the whole plot. Otherwise, the crop area will be less than physical area. For example, a plot of 1 hectare in which maize was grown and completely occupies the whole plot (100 % occupied), it means that cultivated area for maize is 1 hectare. On the other side let us assume that the maize crop occupies 80 % of the total plot area. In that case the area of maize equals 0.8 hectares (1hectare times 0.8).
- In case of mixed cropping system, specifically seasonal crops the crop area is less than physical area. For example, a plot of 1 hectare grown with maize and beans which occupies 60 % and 40 % of total plot area respectively. The maize area will be 0.6 hectare (1hectare times 0.6), and beans area will be 0.4(1hectare times 0.4). It is important to note that sum of shares of seasonal crops do not exceed one hundred percent.
- When seasonal and perennial crops are mixed in same plot, since perennial crops are permanent crops in nature, their shares are treated separately from seasonal crops. The sum of seasonal crops share does not exceed 100 %, while for perennial crops shares are given based on density (spacing between trees) and it may exceed 100 percent. For example, a plot of 1 hectare grown with maize, bean and cassava with 60 %, 40 % and 50% shares respectively.
- Maize area will be 0.6 hectare (1hectare times 0.6), beans area will be 0.4(1hectare times 0.4), while cassava area will be 0.5 hectare (1hectare times 0.5).

9. Developed area

Developed area is the land covered by crops. Due to mixed cropping (over exploitation of agriculture land or under exploitation in case pure cropping), developed area can be less or greater than the physical area.

Basing on the example provided above of the plot in which maize, beans and cassava have been mixed, maize has 0.6, beans have 0.4 while cassava has 0.5 ha. The developed area equals the sum of the crops area equivalent to 1.5 ha.

10. Harvested area

Area harvested is defined as the total number of hectares for all crops that is harvested in a given agriculture season. In case of crops considered as seasonal, the harvested area is assumed to be equal to the cultivated area. For perennial crops a farmer can decide to harvest a portion of land and stores the remaining production in the farm or harvest the whole plot for commercial or other purposes. In this case, the proportion of harvested area is estimated and applied to the plot area to obtain actual harvested area.

For example, cassava which occupies 0.5 hectare has 5,000 trees of cassava. if the farmer only harvested 1,250 trees. In this case, the farmer has harvested only a quarter (0.125hectares) of the cultivated area.

11. Crop yield

Crop yield is defined as total reported quantity of harvested crop over the harvested area of that crop.

12. Crop production

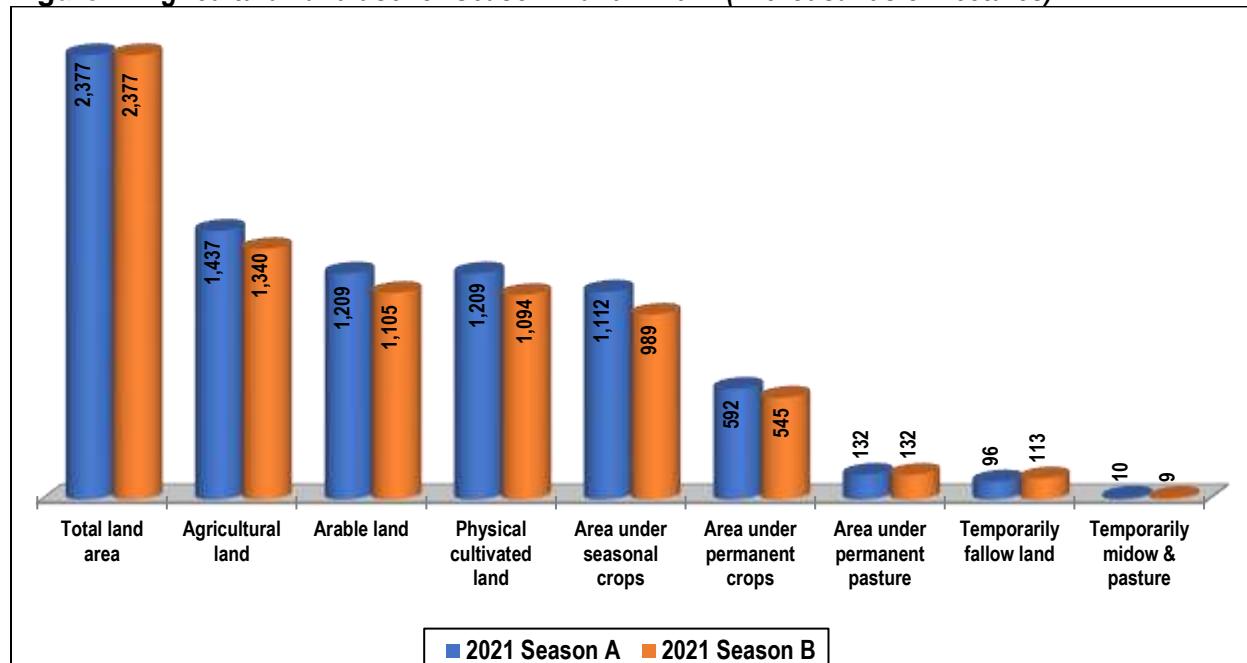

Crop production is the product of crop yield and crop area (harvested). At district level, crop production is estimated by taking crop yield of crop produces times the total harvested area in the district.

III. MAIN FINDINGS

This section presents the main findings covered during the SAS 2021 seasons A, B and C. These results are mainly related to area (physical land use, cultivated area, and harvested area), crop yield and production, agricultural inputs as well as agricultural practices in Rwanda.

3.1. Agricultural land use (1000Ha) for 2021 Season A and B

Figure 2: Agricultural land use for Season A and B 2021 (in thousands of hectares)

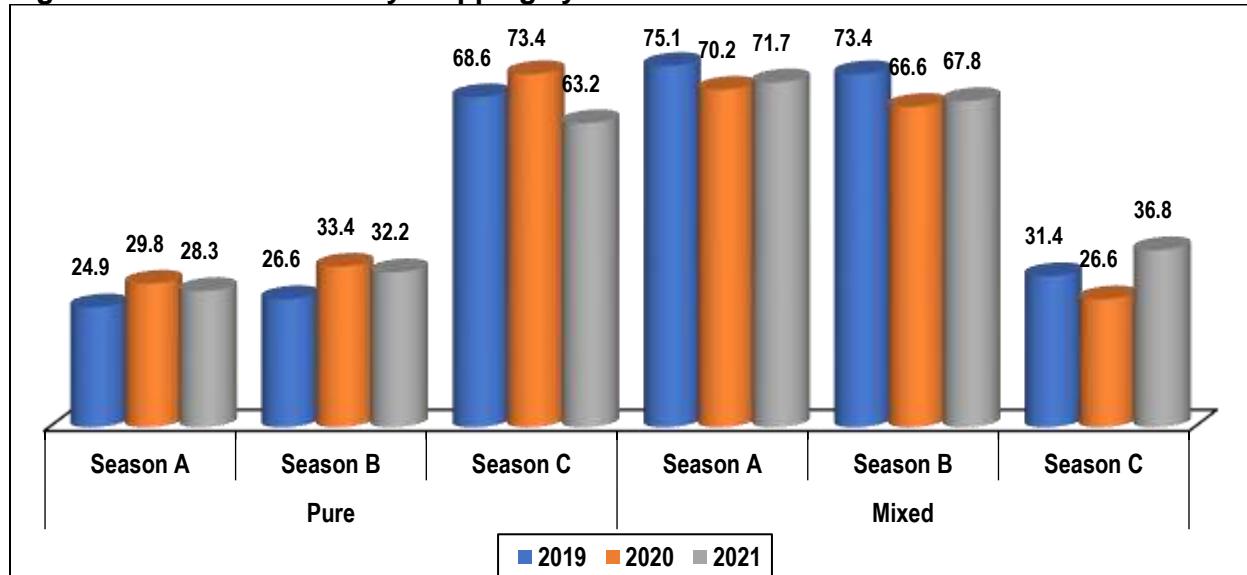

Source: NISR, SAS, 2021

The total country land area is estimated at 2.377 million of hectares for which 1.43 million hectares (56.4% of total country land) is used for agriculture. Out of the total agricultural land, 1.1 million hectares was used for Seasonal crops in season A, nearly 0.6 million hectares are area under permanent crops, 0.131 million ha under permanent pasture while 0.131 million ha was fallow coverage. For season B, 1.340 million hectares (56.4% of total country land) is used for agriculture, 1 million hectares was used for Seasonal crops, nearly 0.6 million hectares are area under permanent crops, 0.132 million ha under permanent pasture while 0.113 million ha was fallow.

3.2.Crop area, yield and production for major crops

Figure 3 : Cultivated area by cropping system

Source: NISR, SAS, 2021

Figure 3 above shows that, the mixed cropping system was done on 71.7 percent of cultivated area in season A compared to 67.8 percent in season B and 36.8 percent in the small season C.

Maize:

- In 2021, Maize was cultivated area estimated at 236,642 hectares and 80,570 hectares in season A and B respectively, an increase of 7 percent and 10 percent in season A and B when compared to respective seasons of 2020. Maize production was 378,641 metric tons in season A and 104,041 metric tons in season B, an increase of 7 percent and 10 percent in season A and B when compared to respective season of 2020. The average yield was 1.6 tons and 1.3 tons in season A and B. (See district details in Tables 8-26).

Sweet potato:

- In 2021, sweet potatoes were cultivated to area estimated at 99,496 hectares and 87,762 hectares in A and B respectively, an increase of 11 percent in season A and 4 percent in season B when compared to respective seasons of 2020. The production of sweet potatoes was 667,346 metric tons and 632,614 metric tons in season A and B respectively, thus an increase of 5 percent and 3 percent when compared to 2020 season A and B production while the average yield was 6.7 tons and 7.2 tons per hectare in season A and B respectively.
- The results of 2021 season C show that the cultivated area under sweet potatoes was 5,583 hectares, a decrease of 6 percent compared to 2020 season C estimates. Likewise, the production for 2021 season C decreased by 1 percent compared to the same season's estimates of the previous year. The average yield of sweet potato was estimated at 5.5 tons per hectare (see district details in table 8-26).

Irish potatoes:

- In 2021, Irish potatoes was cultivated to area estimated at 52,196 hectares in season A and 51,595 hectares in season B, an increase of 1 percent and 17 percent in season A and B when compared to respective seasons of 2020. Irish potatoes production was 463,562 metric tons in season A and 393,371 metric tons in season B, an increase of 8 percent and 12 percent in season A and B when compared to respective seasons of 2020. The average yield of Irish potato was 8.9 tons per hectares in season A and 7.6 hectares per hectare in season B.
- Results of 2021 season C show that the cultivated area under Irish potatoes was 9,667 hectares, an increase of 7 percent when compared to the same season of 2020. The overall production was estimated at 81,348 metric tons, which is an increase of 3 percent when compared to the estimates of the same season in 2020. The average yield for Irish potatoes was estimated at 8.4 tons per hectare (see district details in table 8-26).

Cassava:

- In 2021 cassava was cultivated to area estimated at 200,313 hectares in season A, and 147,320 hectares in season B, an increase of 5 percent in season A and 23 percent when compared to respective seasons of 2020. Besides, harvested area was estimated at 42,284 hectares for season A and 47,837 hectares for season B, up 3 percent for both seasons when compared to respective seasons of 2020. Cassava production was 601,291 metric tons in season A and 718,584 metric tons in season B, an increase of 4 percent and 2.5 percent in season A and B when compared to respective seasons of 2020. The average yield for cassava was 14.2 tons in season A and 15 tons in season B (See district details in Tables 8-26).

Paddy rice:

- In 2021, the cultivated area for paddy rice was estimated to be 15,374 hectares in season A and 16,302 hectares in season B, an increase of 5 percent season A and 8 percent in season B when compared to respective seasons of 2020. Paddy rice production was 63,950 metric tons in season A and 67,808 metric tons in season B, an increase of 22 percent in season A and 5.5 percent in season B when compared to respective season of 2020. The average yield was 4.1 tons per hectare in season A and 4.2 tons per hectares in season B. (See district details in Tables 8-22).

Banana:

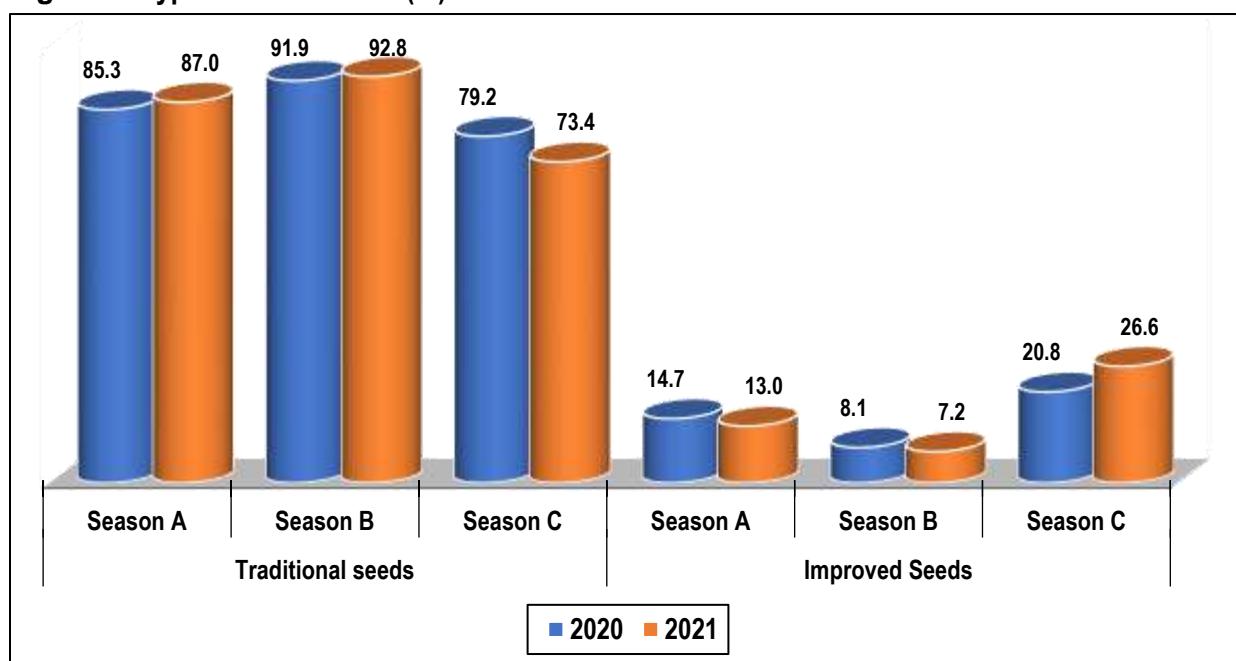

- In 2021, the total cultivated area for banana was estimated at 280,779 hectares in season A and 202,807 hectares in season B, an increase of 3 percent in season A and 2 percent in season B when compared to respective seasons of 2020. Besides, harvested area was estimated at 42,284 hectares for season A and 47,837 hectares for season B, up 6 percent for season A and 3 percent for season B when compared to respective seasons of 2020. The production of banana was estimated at 1,152,365 metric tons in season A and 991,501 metric tons in season B, an increase of 5 percent in season A and 6 percent in season B when compared to respective seasons of 2020. The average yield of banana was 10.9 tons per hectare in season A and 12.1 tons per hectare in season B. (See district details in Tables 8-26).

Beans:

- In 2021, bean's cultivated area was estimated at 389,149 ha in season A and 301,658 in season B, an increase of 7 percent for both seasons A and B when compared to respective seasons of 2020. Bean's production was estimated at 258,851 metric tons in season A and 229,559 metric tons in season B, an increase of 14 percent in season A and 9.6 tons in season B when compared to respective seasons of 2020. The average yield of beans was 0.67 tons per hectare in season A and 0.76 tons in season B.
- The results of 2021 Season C show that beans cultivated area was 3,748 hectares an increase of 40 percent when compared to season C of 2020 while the production was 3,566 metric tons, an increase of 28 percent respectively when compared to season C of 2020. The average yield was estimated at 0.85 tons per hectare (see district details in table 8-26).

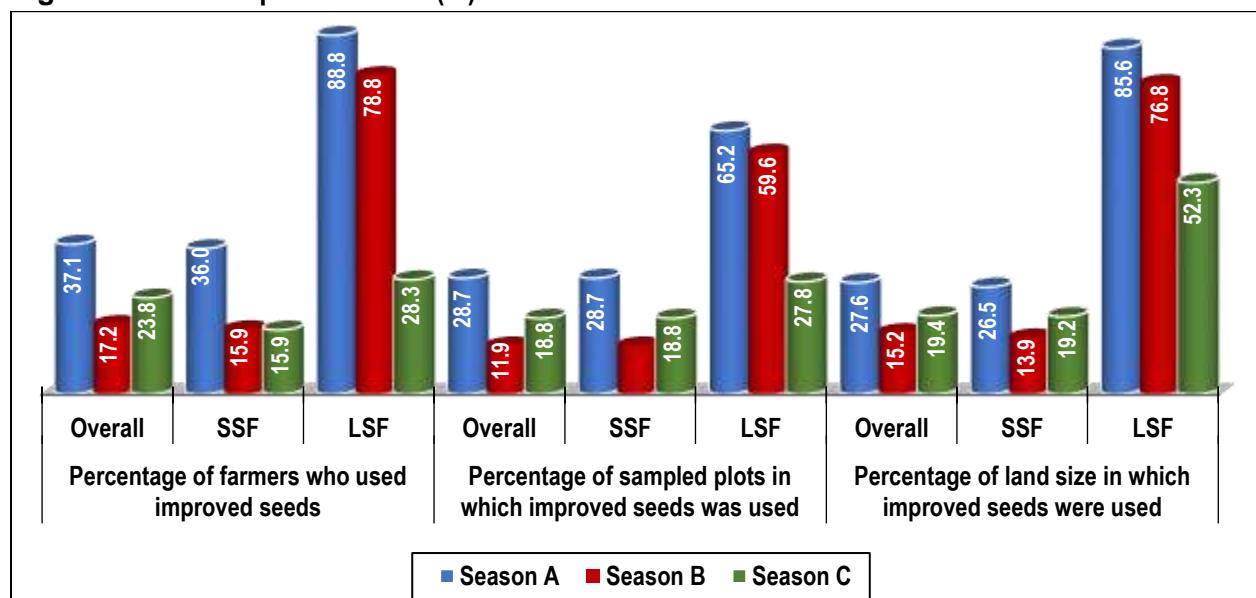

3.3.Agricultural inputs

The survey results related to use of agricultural inputs (seeds, fertilizers and pesticides) are presented in terms of percentage of farmers who applied such agricultural inputs during the season.

3.3.1. Use of seeds**Figure 4: Types of seeds used (%)**

Source: NISR, SAS, 2021

Figure 3 above shows that, out of total seeds used in 2021 87 percent in season A were traditional compared to 92.8 percent in season B and 73.4 in season C. Improved seeds accounted for 13 percent in season A compared to 7.2 percent in season B and 26.6 percent in season C.

Figure 5: Use of improved seeds (%)

Source: NISR, SAS, 2021

In 2021, 37.1 percent of farmers used improved seeds in season A against 17.2 percent in season B and 23.8 percent in season C. In regards to farmer type, 36 percent of small-scale farmers (SSF) and 88.8 percent of Large-scale farmers (LSF) used improved seeds in season A while 15.9 percent of small-scale farmers (SSF) and 78.8 percent of Large-scale farmers (LSF) used improved seeds in season B.

Table 5: Source of improved seeds (%)

	2021			2020		
	Season A	Season B	Season C	Season A	Season B	Season C
NGOs/Companies	39.3	30.3	2.7	28.8	20.0	1.7
Agro dealers	37.6	38.9	39.8	36.6	41.6	48.4
Government (MINAGRI/RAB/NAEB)	8.3	9.2	12.6	16.5	13.1	5.8
Market	5.2	7.1	28.6	5.4	9.4	31.0
Recognized seed multipliers	4.3	7.5	9.3	5.4	9.6	6.6
Agriculture cooperative	4.3	5.9	6.7	6.1	5.3	3.9
Other source	1.0	1.0	0.3	1.4	0.9	2.7

Source: NISR, SAS, 2021

In season A, 39.3 percent of improved seeds came from NGO/companies, 37.6 percent from agro-dealers, 8.3 percent from government, 5.2 percent purchased from market, 4.3 percent from cooperatives, and 4.3 percent from seeds multipliers. In season B, 38.9 percent of improved seeds came from agro-dealers, and 30.3 percent from NGO/companies. Improved seeds were used mostly for crops such as paddy rice, maize, vegetables, fruits and wheat. (See details in Tables 29-34).

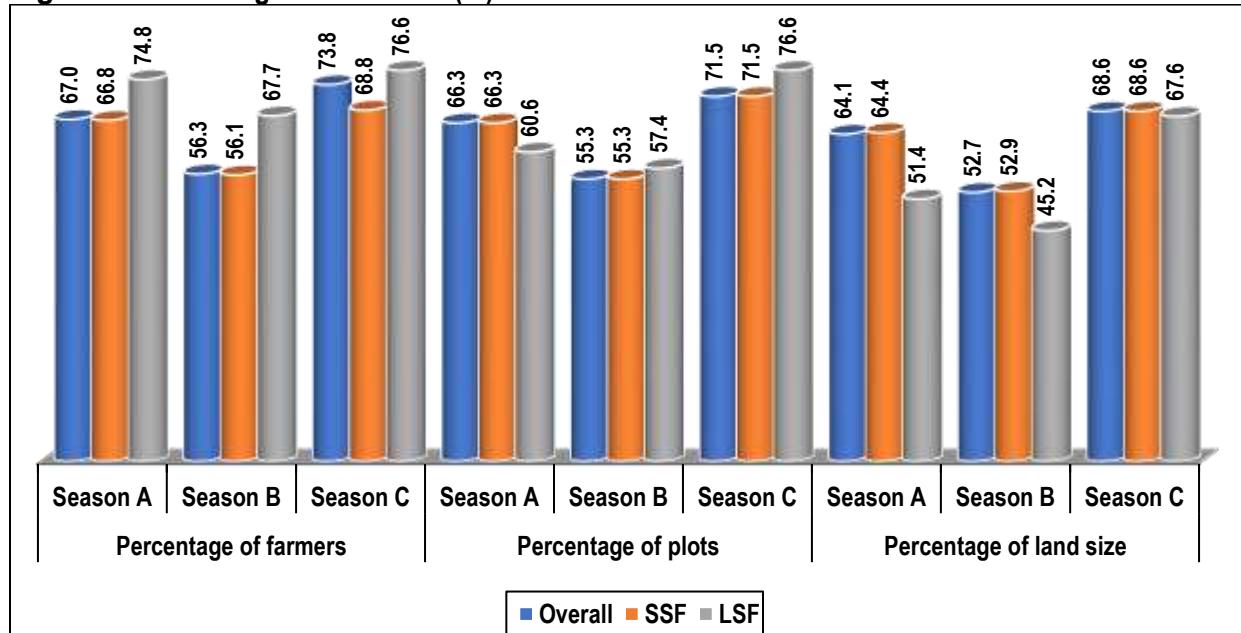

3.3.2. Use of fertilizers

Figure 6 : Percentage of farmers who applied fertilizers

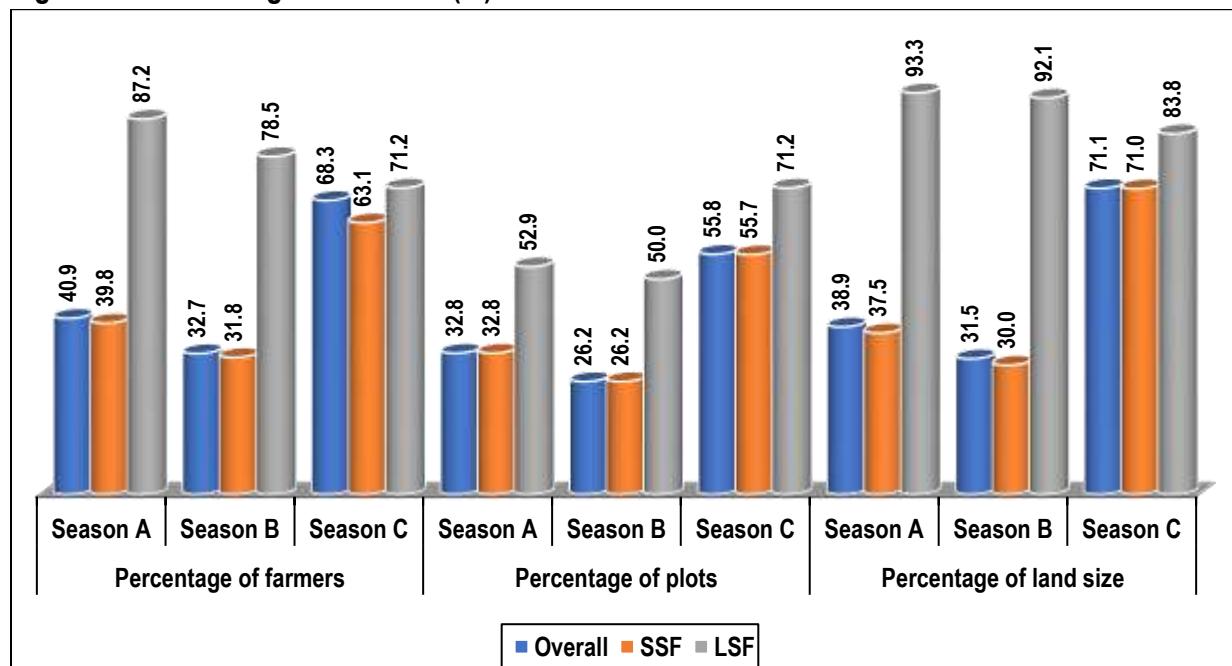

In 2021, 67 percent of farmers applied organic fertilizer in their farms in season A against 56.3 percent in season B and 73.8 percent in season C, while the inorganic fertilizer was applied by 40.9 percent in season A compared to 32.7 percent in season B and 68.3 percent in season C.

Figure 7: Use of organic fertilizers (%)

Source: NISR, SAS, 2021

In regards to farmer types, 66.8 percent of small-scale farmers against 74.8 percent of large-scale farmers applied organic in season A while 56.1 percent of small-scale farmers against 67.7 percent of large-scale farmers applied organic fertilizer in season B (See details in Tables 39-41).

Figure 8: Use of inorganic fertilizer (%)

Source: NISR, SAS, 2021

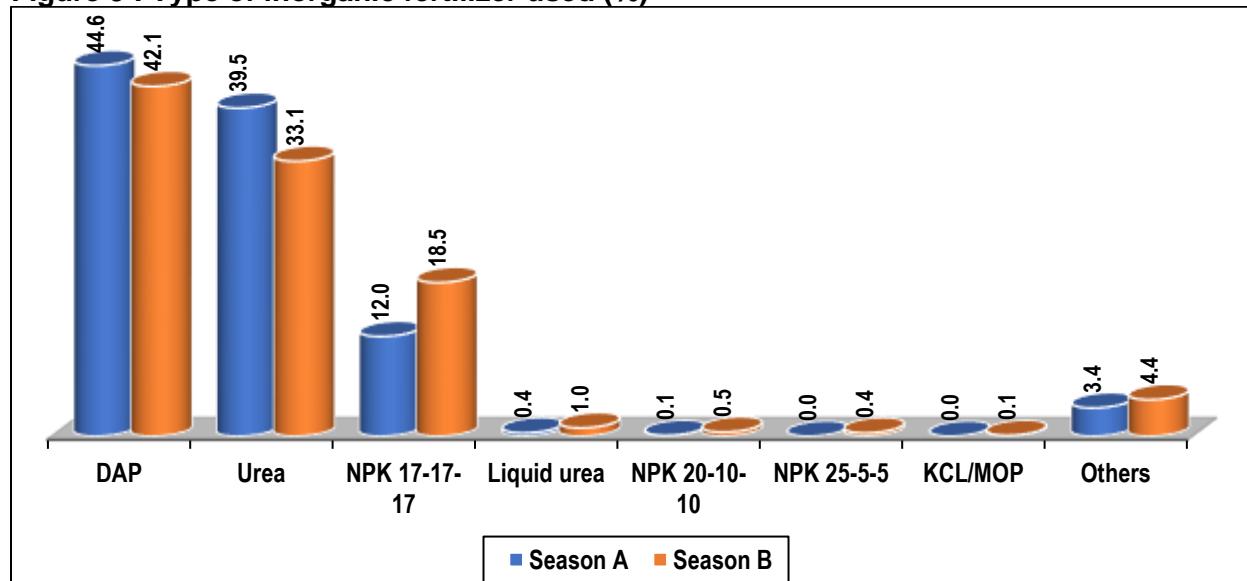

In 2021, 40.9 percent of famers applied inorganic fertilizer in season A against 32.7 percent in season B and 68.3 in season C. In regards to farmer types, 39.8 percent of small-scale farmers against 87.2 percent of large-scale farmers applied inorganic fertilizer in season A compared to 31.8 percent of small-scale farmers and 78.5 percent of large-scale farmers in season B.

Table 6 : Percentage of farmers by source of inorganic fertilizers

	2021			2020		
	Season A	Season B	Season C	Season A	Season B	Season C
Government (MINAGRI/RAB/NAEB)	3.6	3.5	1.7	5.8	5.3	1.3
Agro-dealers	46.0	50.3	64.4	51.0	54.7	68.0
NGOs/Companies	42.2	36.9	15.1	33.4	30.1	14.1
Market	3.8	5.9	10.6	5.1	6.3	10.8
Agriculture cooperative	3.7	3.1	7.8	3.7	3.4	5.3
Other sources	0.7	0.4	0.3	1.0	0.2	0.5

Source: NISR, SAS, 2021

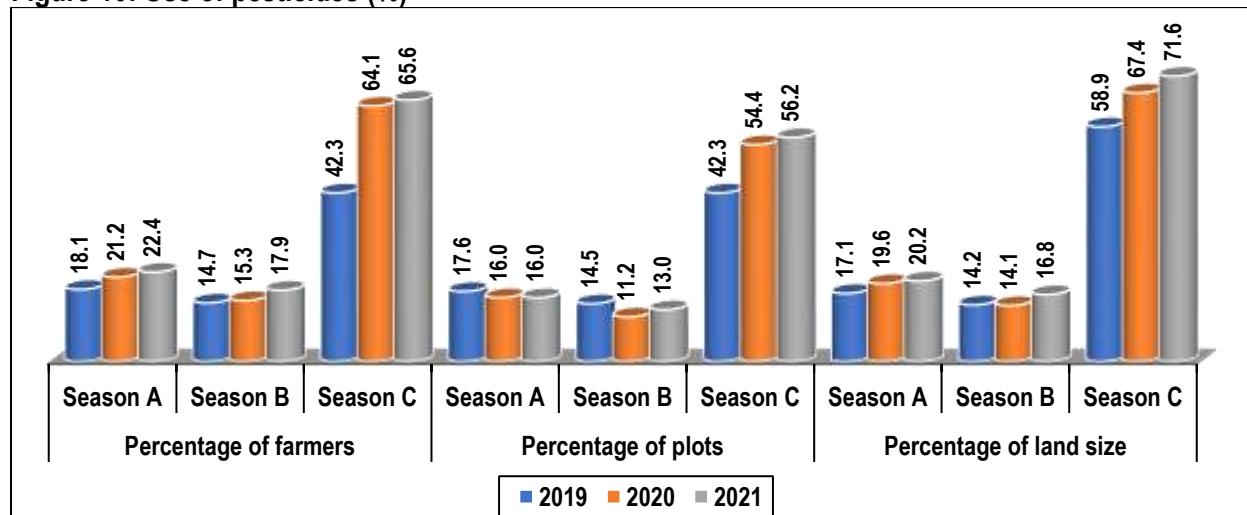

In regards to source of fertilizers, in season A, 46 percent of famers bought inorganic fertilizers from agro-dealers; 42.2 percent of farmers gained inorganic fertilizers from NGOs/companies while in season B, 50.3 percent and 36.9 percent of farmers sourced the inorganic fertilizer from agro dealers and NGOs/companies respectively.

Figure 9 : Type of inorganic fertilizer used (%)

Source: NISR, SAS, 2021

In regards to type of fertilizers, DAP was used by 44.6 percent of farmers, UREA was used by 39.5 percent of farmers while NPK was used by 12.1 percent of farmers in season A. In season B, DAP was used by 42.1 percent of farmers, UREA was used by 33.1 percent of farmers while NPK 17-17-17 was used by 18.5 percent of farmers. (See details in Tables 38-47).

3.3.3. Use of pesticides

Figure 10: Use of pesticides (%)

Source: NISR, SAS, 2021

In 2021, 22.4 percent of farmers applied pesticides in season A against 17.9 percent of farmers in season B and 65.6 percent of farmers in season C. in regards to farmer types, 20.9 percent of small-scale farmers and 87.2 percent of Large-scale farmers applied pesticides in season A compared to 16.6 percent of small-scale farmers and 79.5 percent of large-scale farmers in season B.

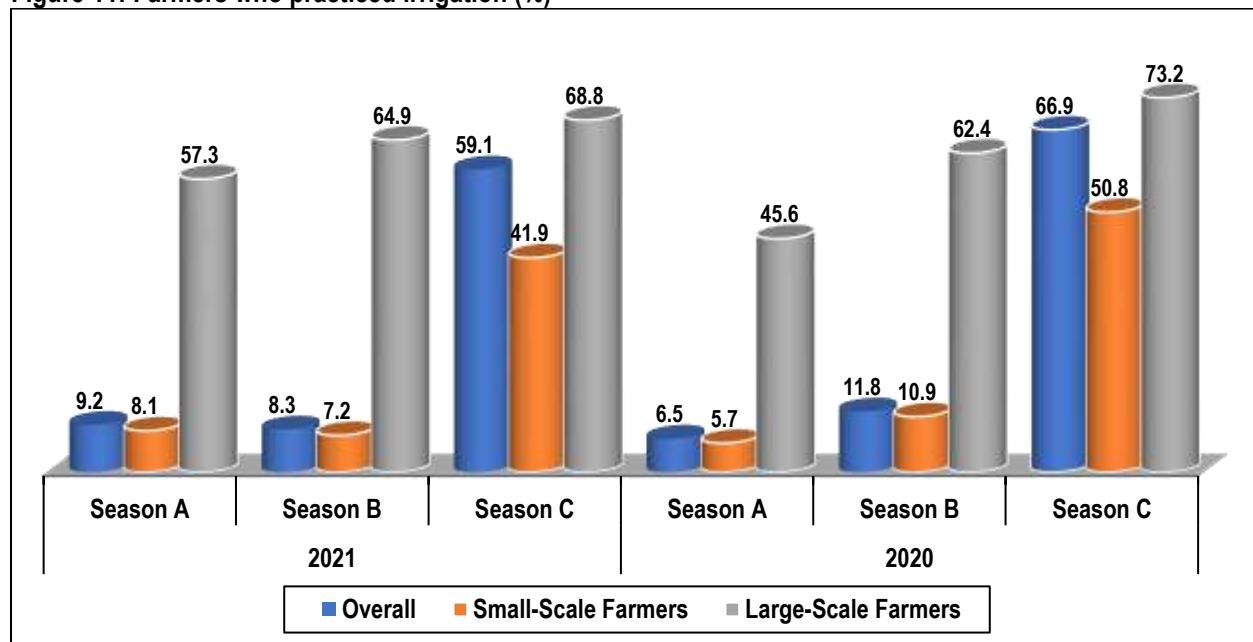

In regards to type of pesticides, 37.8 percent of farmers applied Rocket, 20.9 percent of farmers applied Dithane and 14.3 percent applied Cypermethrin in season A while in season B, 28.8 percent of farmers applied Rocket, 24.6 percent applied Dithane, and 15.8 percent applied Cypermethrin. (See details in Tables 48-51).

3.4.Agricultural practices

During the SAS 2021, information about agricultural practices were collected and the data are presented in terms of percentage of farmers who were involved into such practices.

3.4.1. Irrigation practices

Figure 11: Farmers who practiced irrigation (%)

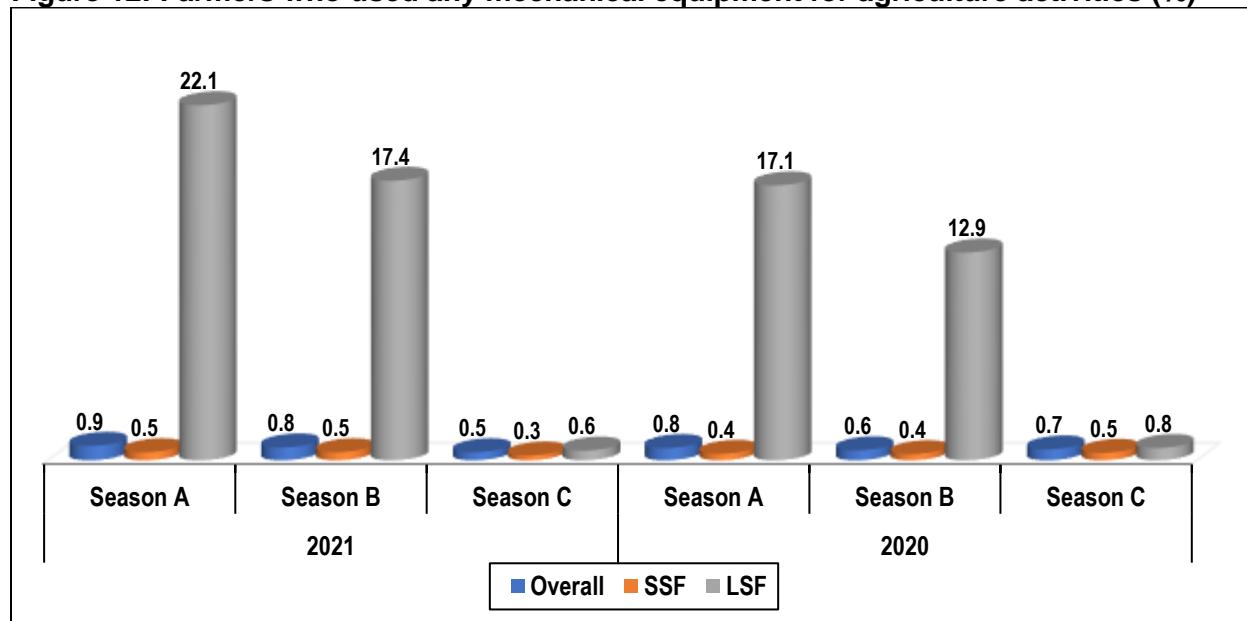

Source: NISR, SAS, 2021

In 2021, 9.2 percent of farmers practiced irrigation in season A compared to 8.3 percent of farmers in season B. In regards to farmer types 8.1 percent of small-scale farmers and 57.3 percent of large-scale farmers practiced irrigation in season A compare to 7.2 percent of small-scale farmers and 64.9 percent of large-scale farmers in season B.

Traditional irrigation technique was practiced by 40 percent of farmers in season A compared to 32.3 percent in season B and 80.4 percent in season C while modern irrigation was practiced by 60.1 percent in season A, 67.8 percent in season B and 19.6 percent in season C. In regards to source of water used for irrigation Lakes/stream is predominant across seasons with 53.7 percent in season A, 51.2 percent in season B and 53.3 percent in season C followed by underground water by 25.6 percent in season A, 27.9 percent in season B and 43.8 percent in season C. (See details in Tables 52-57).

3.4.2. Mechanisation

Figure 12: Farmers who used any mechanical equipment for agriculture activities (%)

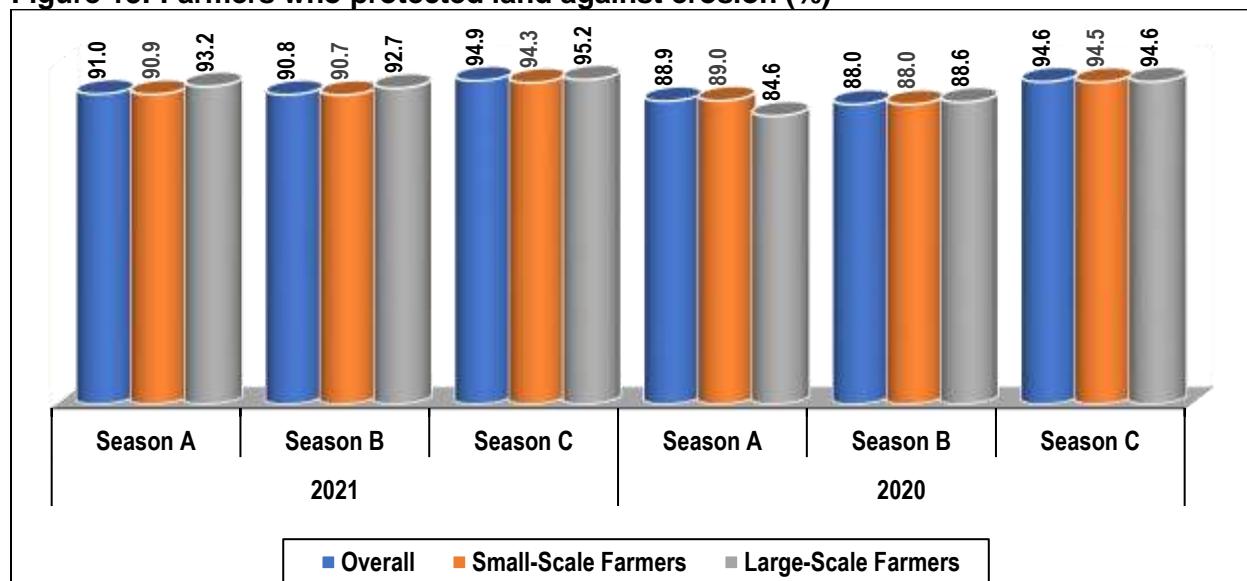

Source: NISR, SAS, 2021

In 2021, 0.9 percent of farmers used mechanical equipment for agriculture in season A compared to 0.8 percent of farmers in season B and 0.5 in season C. In regards to farmer types 22.1 percent of large-scale farmers practiced irrigation in season A compare to 17.4 percent of large-scale farmers in season B. (See details in Tables 53-55)

3.4.3. Erosion control measures

Figure 13: Farmers who protected land against erosion (%)

Source: NISR, SAS, 2021

In 2021, 91 percent of farmers practiced anti-erosion activities in season A compared to 90.8 percent in season B and 94.9 in season C. In regards to farmer types, 90.9 percent of small-scale farmers and 93.2 percent of large-scale farmers protected their land against erosion in season A compared to 90.7 percent of small-scale farmers and 92.7 percent of large-scale farmers in season B.

In regards to types of anti-erosion used, cover plants were the most used type of anti-erosion with 57.2 percent of farmers in season A against 58.7 percent in season B and 29.2 percent in season C. In regards to erosion degree, splash erosion or low erosion appeared the most across season with 55 percent in season A, 56.6 percent in season B and 58.3 percent in season C while severe erosion cases were few across seasons with 2 percent in season A, and 1.6 percent in season B. (See details in Tables 52-57).

3.5 Sowing dates

The SAS 2021 Season A results indicate that 30 percent of crops were planted in September in the dates between 01-15/09 and 16-30/09 2020, and those crops include maize, beans, Irish potatoes, sorghum, peas, cassava and groundnuts. 24 percent of crops were sown in October in the dates between 01-15/10 2020, while the rest of crops have been sown after October 2020. For 2021 season B, 28.7 percent of the crops were sown before in February 2021, 22.7 percent in March 2021, while the rest have been sown after 31/3/2021. For Season C 2021, 36.4 percent of crops were grown in June 2021 and 27.7 percent in May 2021 (see district details in table 26 and 27).

3.6 Gross Value Added (GVA)

The Gross Value-Added value of different crops is shown in current prices at constant price of 2017. The results show that during the 2021 year the gross value added of crops such as maize, sorghum, Paddy rice, cassava, sweet potatoes, banana for beer, cooking banana, Irish potatoes and beans increased comparing to the 2020 year. While the Gross Value Added for crops such as wheat, dessert banana, groundnut, peas, and soya remained constant compared to previous year.

Table 7: Main crops GVA in constant prices (Billion Frw /ha)

Crops	2016	2017	2018	2019	2020	2021
Maize	402,114	309,457	365,527	373,066	389,059	387,753.86
Sorghum	274,987	296,000	298,689	274,485	280,068	299,995.94
Paddy rice	1,304,073	1,633,520	1,492,544	1,718,397	1,691,890	1,799,479.73
Wheat	237,012	282,068	306,210	329,278	289,132	303,795.29
Cassava	177,496	305,145	1,377,459	1,629,739	1,642,935	1,653,321.67
Sweet potato	808,499	784,244	899,497	890,254	932,227	903,968.81

ANNEX

Annex 1: SAMPLING ERRORS

The sample survey results can be influenced by two types of errors: (i) sampling errors and (ii) non-sampling errors. Non-sampling errors encompass all sources of errors unrelated to sampling, occurring throughout all aspects of the survey process during data collection and processing. They are categorized into four types: coverage errors, measurement errors, non-response errors, and processing errors. While efforts are made during the survey implementation to minimize these errors, it is not possible to eliminate all of them, and non-sampling errors are often extremely difficult, if not impossible, to measure.

Sampling errors are associated with the sampling selection process, arising from observing a sample instead of the entire population. They denote the disparity between the estimate derived from a sample survey and the true value that would result if a census of the whole population were conducted under the same conditions.

The sample of segments and plots selected for the SAS 2020/21 is one of many possible samples. The estimates obtained from the selected sample would differ from estimates which could be obtained from other samples of the same size and sampling method taken from same population. Sampling error causes variability among estimates derived from different samples when keeping the same sample size and design, and the same estimation method used. It's measured commonly by the standard error which is the square root of the sampling variance. The variance depends on many things, including the sampling method, the estimation method, the sample size, and the variability of the estimated characteristic.

To assess the accuracy of key estimates derived from the SAS 2020/21 data and to evaluate the statistical efficiency of the sampling frame and sample design, it is crucial to compute the sampling errors and corresponding coefficients of variation (CVs) for these estimates, including the total area for each major crop. The sampling error for each estimate is quantified by the standard error, which is the square root of the variance. The Complex Samples module in SPSS and Stata employs a linearized Taylor series variance estimator, considering the stratification and clustering inherent in the sample design.

The variance estimator for a total used by the Complex Samples module of SPSS and Stata can be expressed as follows:

Variance Estimator for a Total

$$V(\hat{Y}) = \sum_{h=1}^L \left[(1 - f_h) \times \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right)^2 \right],$$

where:

f_h = first stage probability for stratum h; $(1 - f_h)$ is the finite population correction (fpc) factor

$$\hat{Y}_{hi} = \sum_{j=1}^{m_h} W'_{hj} y_{hij}$$

y_{hij} = value of variable y for the j-th sample plot in the i-th sample segment of stratum h

$$\hat{Y}_h = \sum_{i=1}^{n_h} \hat{Y}_{hi}$$

Variance Estimator for a Ratio

$$V(\hat{R}) = \frac{1}{\hat{X}^2} \left[V(\hat{Y}) + \hat{R}^2 V(\hat{X}) - 2 \hat{R} COV(\hat{X}, \hat{Y}) \right],$$

where:

$$COV(\hat{X}, \hat{Y}) = \sum_{h=1}^L (1 - f_h) \times \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{X}_{hi} - \frac{\hat{X}_h}{n_h} \right) \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right)$$

$V(\hat{Y})$ and $V(\hat{X})$ are calculated according to the formula for the variance of a total.

In addition to calculating the standard error, the program also computes the Design Effect (DEFF) for the main indicator, which is the area under cultivation. The Design Effect is defined as the variance of an estimate based on the actual complex sample design divided by the corresponding variance from a simple random sample of the same size. It serves as a measure of the relative statistical efficiency of the sample design, taking into account both the stratification and clustering present in the sample design.

The presence of clustering typically increases the design effect, owing to the intra-cluster correlation of plots within the segments. Simultaneously, the land-use stratification of the segments tends to decrease the design effects, as it proves to be more efficient than a simple random sample. This dual consideration of both factors provides a comprehensive assessment of the efficiency of the sample design in capturing the nuances of the area under cultivation. The estimates of the total area of major crops at the national level and the corresponding measures of precision (standard error (SE), the coefficient of variation (CV), the 95 percent confidence interval, the design effect (DEFF), and number of unweighted observation (n of sample plots)) from the SAS 2020/21 data of 3 seasons are presented in Table 1 for season A, Table 2 for season B and Table 3 for season C.

Table 1. Estimates of total area by major crop at the national level from the SAS 2020/21 Season A data, with standard error, CV, 95% confidence interval, design effect and number of sample observations

Soybean	27,493	1586.3	0.058	24,380	30,605	0.078	1,201
Vegetables	19,093	1245.1	0.065	16,650	21,536	0.414	834
Cooking banana	108,451	4,992.8	0.046	98,655	118,247	2.038	3,695
Dessert banana	41,394	1,619.6	0.039	38,216	44,571	1.637	3,474
Banana for beer	130,934	4,787.9	0.037	121,540	140,328	1.443	4,038
Cassava	200,313	6223.8	0.031	188,102	212,524	2.074	6,391
Fruits	11,202	1568.6	0.140	8,124	14,280	0.193	388

For Season A, the confidence interval (e.g., as estimated cultivated area for maize) can be interpreted as follows: the estimated area under cultivation of maize is 236,642 hectares, and its standard error is 6,875.3 Therefore, to obtain the 95 percent confidence limits, adds, and subtracts the standard error to the sample estimate times confidence interval value. There is a high probability (95 percent) that the true, area under maize cultivation is between 223,152 ha and 250,131 ha.

A DEFF value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates an increase in the sampling error due to the use of a more complex and less statistically efficient design, such as multistage and cluster selection. It can be seen in the results that the design effects for the estimates of total area for some crops are lower than 1, indicating that the increase in sampling efficiency from the land-use stratification more than off-sets the effects of clustering for these crops.

Table 2. Estimates of total area by major crop at the national level from the SAS 2020/21 Season B data, with standard error, CV, 95% confidence interval, design effect and number of sample observations

Crop name	Estimate	SE	CV	95% Confidence Interval		DEFF	N of observations (Plots)
				Lower	Upper		
Maize	80,570	3210.1	0.040	7,4273	86867	.023	3348
Sorghum	133,033	5498.2	0.041	122,247	143819	1.384	2696
Bean	301,658	6490.9	0.022	288,925	314392	.307	8524
Irish potato	51,595	3310.4	0.064	45,101	58089	.829	1775
Sweet potato	87,762	3031.7	0.035	81,815	93710	2.485	2719
Taro	15,088	879.4	0.058	13,363	16813	1.185	801
Soybean	25,574	1395.6	0.055	22,836	28311	.120	1180
Vegetables	15,574	1332.1	0.086	12,960	18187	.391	639
Cooking banana	71,262	3433.9	0.048	64,526	77998	1.628	3791
Dessert banana	37,668	1503.1	0.040	34,720	40617	1.786	3556
Banana for beer	93,877	3700.2	0.039	86,618	101136	1.572	4116
Cassava	147,320	3736.0	0.025	139,991	154649	1.313	6181
Fruits	8,371	1214.2	0.145	5,989	10753	.236	371

For Season B, the confidence interval (e.g., for the estimated cultivated area of beans) can be interpreted as follows: the estimated area under cultivation for beans is 301,658 hectares, with a standard error of 5,498.2. Therefore, to obtain the 95 percent confidence limits, one adds and subtracts the standard error from the sample estimate multiplied by the confidence interval value. There is a high probability (95 percent) that the true area under beans cultivation falls between 288,925 ha and 314,392 ha.

A DEFF value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a value greater than 1.0 indicates an increase in sampling error due to the use of a more complex and less statistically efficient design, such as multistage and cluster selection. It can be observed in the results that the design effects for the estimates of total area for some crops are lower than 1, indicating that the increase in sampling efficiency from the land-use stratification more than offsets the effects of clustering for these crops.

Table 3. Estimates of total area by major crop at the national level from the SAS 2020/21 Season C data, with standard error, CV, 95% confidence interval, design effect and number of sample observations

Crop names	Estimate	SE	CV	95% Confidence Interval		DEFF	N of observations (Plots)
				Lower	Upper		
Bean	3,748	267.0	0.071	3222	4273	0.004	866
Irish potato	9,667	1034.2	0.107	7632	11701	1.370	999
Sweet potato	5,226	317.2	0.061	4602	5850	0.522	1308
Soybean	741	183.8	0.248	380	1103	0.117	120
Vegetables	5,061	347.6	0.069	4377	5745	0.235	3973

For Season C, the shortest agricultural season in Rwanda, the confidence interval (e.g., for the estimated cultivated area of vegetables) can be interpreted as follows: the estimated area under cultivation for vegetables is 5,061 hectares, with a standard error 347.6. Therefore, to obtain the 95 percent confidence limits, one adds and subtracts the standard error from the sample estimate multiplied by the confidence interval value. There is a high probability (95 percent) that the true area under Vegetables cultivation falls between 4377 ha and 5745 ha.

Annex 2: STAFF WHO CONTRIBUTED TO THE SEASONAL AGRICULTURAL SURVEY 2021

National Coordinators

- Yusuf MURANGWA, Director General, NISR
- Ivan MURENZI, Deputy Director General, NISR

Technical coordination

- MWIZERWA Jean Claude, Director of Economic Statistics Department
- ABAYISENGA Aimable, Agriculture and Environmental Statistician Team Leader
- BIZIMUNGU Clément, Field operations Cartographer Officer

Sample frame design

- ABAYISENGA Aimable, Agriculture and Environmental Statistician Team Leader
- BURAMBA Eric, Seasonal Crop Production Statistician

Field work coordination

- KAMANZI SHINGIRO Jean Philbert, Research assistant
- MUKAMAZIMPAKA Francine, Perennial crops and horticulture statistician
- UWIZEYIMANA Lambert, Forestry and environmental statistics statistician
- RWAYITARE Jean Bosco, Research assistant

Data analysis

- ABAYISENGA Aimable, Agriculture and Environmental Statistician Team Leader
- BURAMBA Eric, Seasonal Crop Production Statistician
- UWAMAHORO Didas, Regional price and economic data collector officer
- MUVUNYI Issa, Livestock and fisheries production statistician
- MUTEBUTSI Alexis, Research assistant
- MUREBWAYIRE Divine, Research assistant
- UWIZEYIMANA Lambert, Forestry and environmental statistics statistician

GIS

- BIZIMUNGU Clément, Field operations Cartographer Officer
- KARERA Albert, Geometrician in charge of map design & production
- NTAWIHA Athanasie, GIS staff
- NIYITEGEKA Beata, Cartographer support staff
- NDAZIGARUYE Alfred, Cartographer support staff
- NGABO MUHIRE Olympe, GIS Support Staff
- KICONCO Jovia, GIS Support Staff

Data processing

- SEBAHIRE Jean Népomuscène, Food Security & Agriculture Surveys Data Processing Officer
- RWAYITARE Jean Bosco, Research assistant

Report writing and editing

- MUTEBUTSI Alexis, Research assistant
- UWAMAHORO Didas, Regional price and economic data collector officer
