FOREWORD

Since 2012, the National Institute of Statistics of Rwanda (NISR) has been conducting the Seasonal Agricultural Survey (SAS) to provide timely and accurate estimates on national crop production, cultivated and harvested areas, crop yields, agricultural inputs, and farming practices. These data are crucial for monitoring the progress of agricultural programs and policies in Rwanda. The survey is carried out in close collaboration with the Ministry of Agriculture and Animal Resources (MINAGRI), the National Agricultural Export Development Board (NAEB), and the Rwanda Agriculture and Animal Resources Development Board (RAB).

This report highlights the significance of the Seasonal Agricultural Survey as a vital tool for monitoring national agricultural programs. By providing essential data, the SAS enables policymakers and stakeholders to identify priority intervention areas and address critical agricultural challenges effectively.

NISR values the feedback from all data users on this publication. In this regard, we are committed to continuously enhancing the variety of our analyses and the presentation of results to better support the effective use of our findings. NISR congratulates all those who contributed to this exercise.

In particular, NISR expresses its gratitude to the survey coordinators, supervisors, analysts, team leaders, interviewers, drivers, and respondents for making this survey possible.

NISR also encourages stakeholders, government agencies, researchers, partners, and the general public to make optimal use of the findings of this report for evidence-based decision-making and to drive the development of Rwanda's agricultural sector.

MURENZI Ivan

Director General, NISR

EXECUTIVE SUMMARY

This is the annual report for the Seasonal Agricultural Survey (SAS) conducted by the National Institute of Statistics of Rwanda (NISR) for the agricultural year 2023/2024, which covers three primary agricultural seasons in Rwanda. The main agricultural seasons include Season A, spanned from September 2023 to February 2024, Season B which started from March to June 2024, and Season C which started from July to September 2024.

Key findings

A comprehensive summary of the primary indicators assessed during SAS 2024 is presented in Table 0. It includes crop production, yield estimates, land use, use of agricultural inputs and agricultural practices.

Land use

In 2024 Season A, the total country land area is estimated at 2.376 million of hectares for which 1.372 million hectares (approximately 58% of total country land) is used for agriculture. 1 million hectares were used for Seasonal crops, 0.511 million hectares were covered by permanent crops, while 0.124 million hectares were used for permanent pasture. Likewise, in season B, the total country land area is estimated at 2.376 million of hectares for which 1.350 million hectares (approximately 57% of total country land) is used for agriculture. In addition, 0.987 million hectares were used for seasonal crops, 0.513 million hectares were covered by permanent crops, while 0.116 million hectares were used for permanent pasture.

Use of inputs

Common agricultural inputs include improved seeds, organic and chemical fertilizers, as well as pesticides and fungicides. In 2024, 39.7% of farmers used improved seeds in season A, 18% in season B, and 18.8% in season C. The use of organic fertilizers was higher, with 89.1% of farmers applying them in season A, 80.1% in season B, and 78.8 % in season C. In contrast, the use of inorganic fertilizers varied, with 64.5% of farmers using them in season A, 52% in season B, and 60.4 % in season C. Regarding pesticides and fungicides, 39.8% of farmers applied them in season A, 30.2% in season B, and 59.8 % in season C.

Agricultural practices

In season A of 2024, 7.5 percent of farmers practiced irrigation compared to 12.1 percent of farmers in season B and 58.2 percent in season C. In 2024 Season A, 90.6 percent of farmers practiced anti-erosion activities, compared to 89.2 percent of farmers in season B and 92.9 percent of farmers in season C.

INTRODUCTION

Agriculture continues to be one of the most important pillars of economic growth for Rwanda, and a much emphasis for agriculture transformation has been underpinned under the new national development strategy (NST 2). In recognition of its potential in economic development, food security and poverty reduction, the government has set an ambitious agricultural agenda under the new strategy for transformation of agriculture (PSTA 5) aiming at transformation of Rwandan agriculture from a sector characterised by low productivity to a sector using knowledge to increase productivity and investing in value addition and commercialization.

High-quality agricultural statistics plays a vital role in assessing the performance of national agricultural programs and hence, imperative for evidence-based decision making. While the use of statistics in decision-making processes continues to grow, the demand for agriculture data is also increasing. In this regard, the National Institute of Statistics of Rwanda (NISR) in collaboration with the Ministry of Agriculture and Animal Resource (MINAGRI) conducts the Seasonal Agricultural Survey (SAS) to gather agriculture information mainly related to potential agricultural land use, crop area, yield, and production, agricultural inputs, agricultural practices as well as other agricultural statistics.

The survey data are supplemented by administrative records collected by the National Agricultural Export Development Board (NAEB) through routine activities of monitoring coffee and tea production. NISR conducts the Seasonal Agricultural Survey (SAS) following three main agricultural seasons. Season A (September to February of the following year), Season B (March to June) while Season C (July-September) is a shorter season mainly for vegetables and sweet potato grown in swamps and Irish potato grown in the volcanic agro-ecological zone.

Every three years, SAS undergoes an upgrade to revise the sample frame based on changes in land classes and subsequently select new sample segments to be surveyed over the subsequent three-years. This report outlines the third upgrade of the Seasonal Agriculture Survey, detailing enhancements to the area frame, data collection activities, and key findings for three Seasons.

1.1 Objective of Seasonal Agricultural Survey

The main objective of SAS is to provide timely, accurate, reliable, and comprehensive agricultural statistics that describe the structure of agriculture in Rwanda mainly in terms of land use, crop area, yield, and crop production. The survey results are useful to monitor the current agricultural and food supply conditions to facilitate evidence-based decision making for the development of the agricultural sector.

The survey specifically captures data related to land use, including agricultural land, arable land, physical crop cultivated area, crop land, pastureland, and fallow land. It also gathers information on crop production, measuring the quantity of harvested crop in kilograms or tons. Additionally, the survey assesses crop yield, indicating the quantity of crop harvested per unit of land area in kilograms per hectare. Moreover, it examines the use of inputs such as improved seeds, fertilizers, and pesticides. Finally, the survey delves into various agricultural practices, including irrigation, soil erosion protection, agroforestry, and agriculture mechanisation

SURVEY METHODOLOGY

2.1. Sample design

To provide the basis for conducting probability surveys that comprehensively cover farm-level data and to enhance the precision of survey estimates, SAS uses a Multiple Frame Sampling (MFS) methodology. This approach involves constructing an area frame from which the survey sample is drawn. In addition, a list frame of Large-Scale Farmers (LSF), with at least 10 hectares of agricultural land, is done to complement the area frame. This ensures coverage of crops predominantly cultivated by large-scale farmers, which may not be adequately represented in the area frame alone. The construction of an area frame involves several steps, including land cover classification, land stratification and sampling of segments.

2.1.1. Land cover classification

Land classification is the first step in the designing of the sampling frame of the Seasonal Agriculture Survey. This process involves categorizing the total available land in the country into different land use or land cover types with the purpose of enhancing sampling precision by targeting the adequate land. With a combination of different spatial layers available in the country, plus a photo interpretation of a series (2010 to 2023) of high-resolution (50 to 30 cm) satellite images the total land of the country was divided into 14 land cover classes (as shown in Table 1).

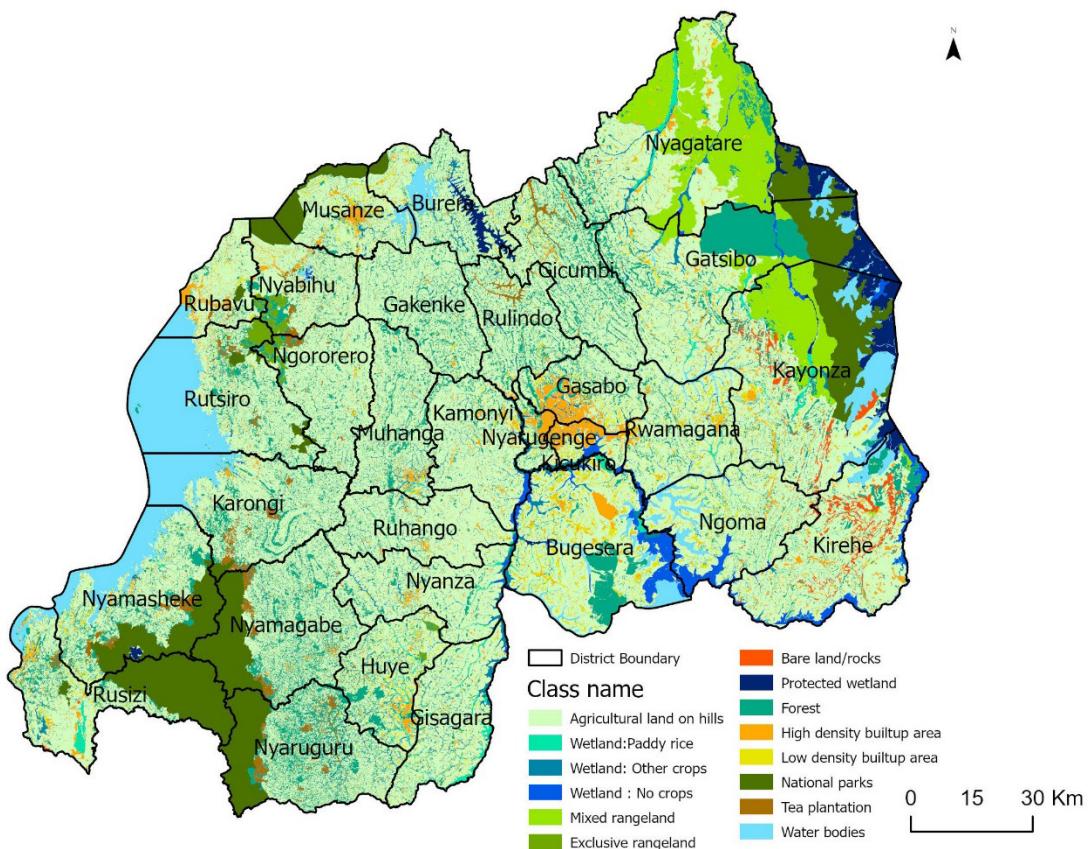

Table 1: List of Rwanda land cover classes

No	Class name	Area (Ha)	Percentage share
1	Agricultural land on hills	1,307,956	51.7
2	Non-rice Agricultural Wetland	56,905	2.2
3	Mixed rangeland	127,640	5.0
4	Low-density built-up area	95,740	3.8
5	Paddy rice wetland	22,825	0.9
6	Tea plantation	23,732	0.9
7	Non cropped wetlands	36,846	1.5
8	Forest	381,391	15.1
9	National parks	190,247	7.5
10	Water bodies	155,030	6.1
11	High-density built-up area	58,657	2.3
12	Protected wetland	45,883	1.8
13	Bare land/rocks	15,412	0.6
14	Exclusive rangeland	13,064	0.5

Source: NISR, SAS 2024

Among 14 land cover classes, only 6 are related to agricultural activities include Agricultural land on hillside, non-rice agricultural Wetland, mixed rangeland, Low-density built-up area, wetlands designated for Paddy rice and Tea plantation.

Map 1: Rwanda land classification map

Source: NISR, SAS 2024

The subsequent step involves constructing the area frame which includes grouping the land cover classes linked to agricultural activities into strata to identify agricultural strata to be considered in the sampling frame

2.1.2.Land stratification.

The stratification is a result of a combination of sampling units (clusters) and land use/land cover. The stratification assigns each cluster a stratum based on the predominant land class type. Among the fourteen land cover classes, four are included in the agricultural survey frame, while the others are excluded.

The included land cover classes comprise hillside agricultural land, non-rice agricultural land, mixed rangeland, and Low-density built-up area (with potential for agricultural production, including kitchen gardens, fruit trees, and livestock). Certain agricultural land classes are excluded from the sampling frame. For instance, tea plantations are omitted due to regular monitoring by the National Agricultural Export Development Board (NAEB), and wetlands designated for paddy rice cultivation are typically considered in Large-Scale Farmers, making them another component of the survey frame. Moreover, Since the 2024 SAS, a new land cover class called Exclusive Rangeland has been introduced specifically for areas used for pastoral activities. This class is also excluded from the sampling frame.

By overlapping the clusters layer with land cover classes layer, each cluster is assigned a dominant land cover class as a stratum definition, basing on a defined threshold as follow:

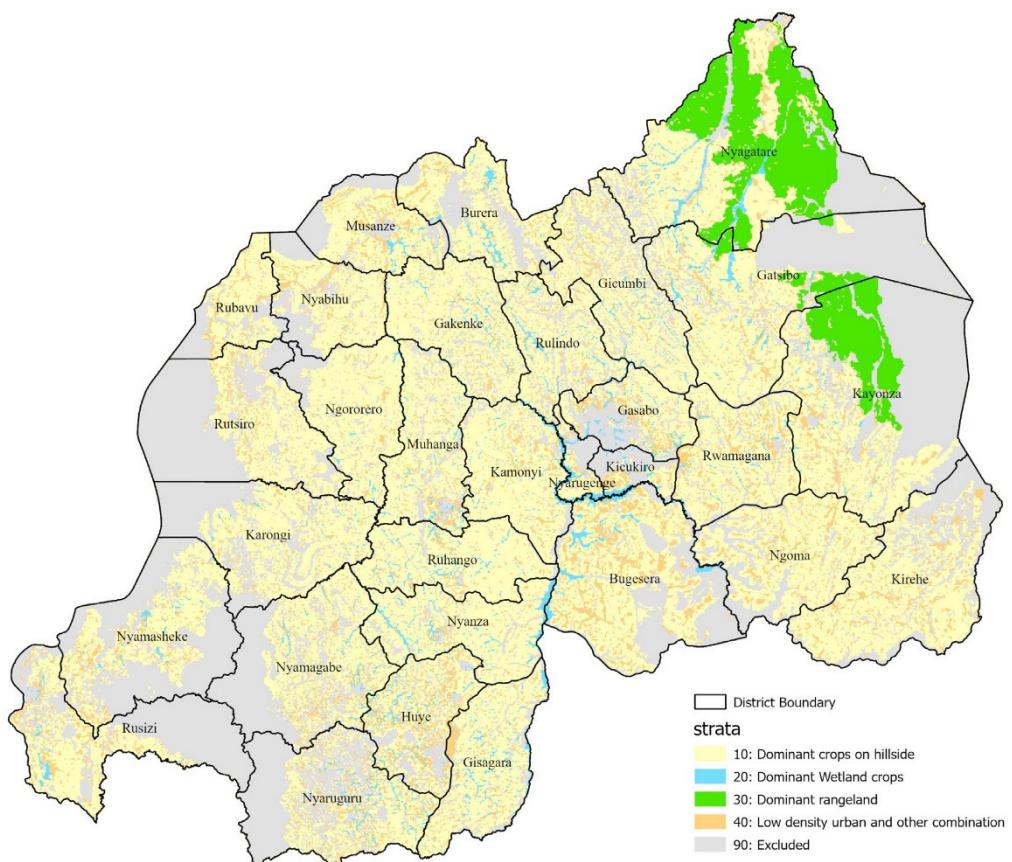

Table 2: List of strata

Stratum code	Stratum name	Definition
1.0	Dominant hill crop land	Clusters with Hillside agricultural land cover class greater or equal to 60 percent of the total area of the cluster
2.0	Dominant Wetland crops	Clusters with non-rice wetland land cover class greater than 25 percent of total area of the cluster
3.0	Dominant rangeland	Clusters with mixed rangeland land cover class greater or equal to 60 percent of the total area of the cluster
4.0	Mixed	The rest of other possible combinations
9.0	Excluded	All clusters with excluded land cover classes greater or equal to 50 percent of the total area of the cluster

Source: NISR, SAS 2024

The SAS sample is drawn from four main strata: dominant hill crop land, dominant wetland crops, dominant rangeland, and mixed land strata

Map 2: Distribution of stratified clusters by district

Source: NISR, SAS 2024

2.1.3. Sampling Units

The Seasonal Agricultural Survey is an area-based sample survey. It uses land sampling units, small square land units of 300 by 300 meters (9ha). Geographic Information System (GIS) technology is used to create the units covering the whole country. In total the sampling frame has 269,989 square units (clusters) for season A and B and 144,915 square units (clusters) for season C. Each one of the clusters is identified with a unique cluster number as shown on the map below.

2.1.4. Sampling procedures

Out of Five defined strata, only dominant hill crop land stratum, dominant wetland crops stratum, dominant rangeland stratum and mixed stratum are considered as land potential for agriculture. The remaining stratum is the non-agricultural land. Note that clusters covered by tea plantations and wetlands designated for paddy rice cultivation are not considered in the area sample frame due to reasons stated above. Thus, SAS is conducted on 4 above mentioned strata. At first stage, 1200 segments are selected and allocated at district level based on the power allocation approach (Bankier, 1988¹). Sampled segments inside each district are

¹ Bankier M.D. (1988) Power allocations: determining sample sizes for subnational areas. The American Statistician, Vol. 42, n. 3 pp. 174-177.

distributed among strata with a proportional-to-area criterion. Specifically, for Season C, a shorter season that does not cover the entire land potential for agriculture, the sample was selected only from three sub-strata: Dominant Wetland, Season A and B frames in the volcanic agro-ecological zone with consistent rainfall, and special sites with irrigation infrastructure. For Season C, 946 segments were selected and allocated at the district level.

Table 4: Allocation of sampled segments per district by stratum

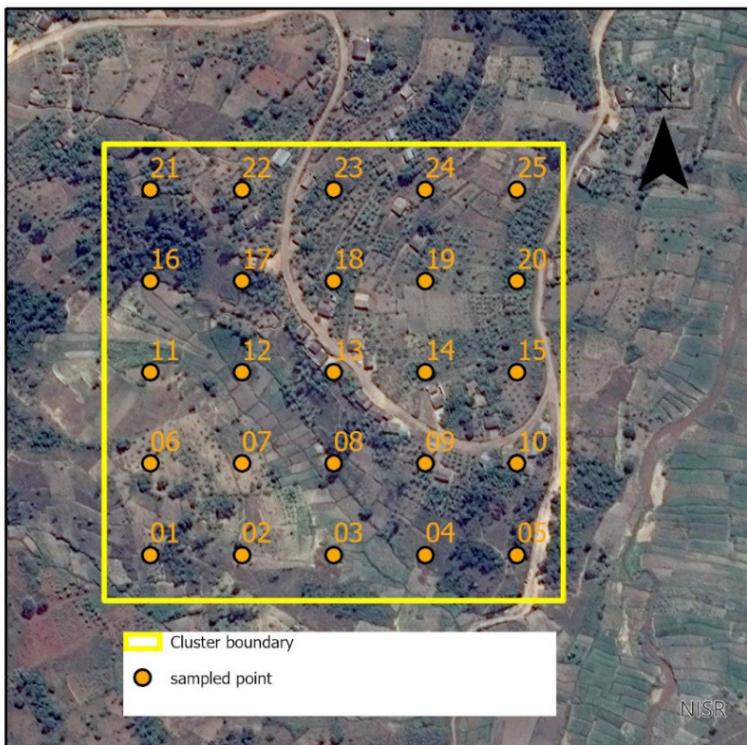

District	Stratum				Total A & B	Season C
	Dominant hill crop land	Dominant wetland crops	Dominant rangeland	Mixed stratum

Total	948	75	43	134	1,200	946

Source: NISR, SAS 2024

At the second stage, 25 sample points are systematically selected, following a special distance of 60 meters between points. Sample points serve as reporting units within each segment. Enumerators visit each point, identify and delineate the plots in which the sample point falls, and collect records of land use and related information.

The recorded information represents the characteristics of the whole segment which are extrapolated to the stratum level and hence the combination of strata within each district provides district area related statistics.

Map 4: Map showing square cluster(segment) with 25 sampled points

Source:

NISR, SAS 2024

2.1.5 Weighting Procedures

Based on the stratified two-stage sample design used with the new area frame, the first stage sampling probability for the sample segments in each stratum is calculated as:

$$p_{1h} = \frac{n_h}{N_h}$$

Where:

p_{1h} = probability of selection of sample segments in stratum h (district by stratum)

n_h = number of sample segments selected in stratum h

N_h = total number of segments in the area frame for stratum h in each stratum

The second stage probability was calculated at the plot level based on the assumption that the plots within each sample segment were implicitly selected with PPS using the area of the plot as the measure of size. Therefore, the second stage probability of selection can be expressed as follows:

$$p_{2hi} = \frac{g_{hi} \times A_{hij}}{A_{hi} \times g_{hij}}$$

Where:

- p_{2h} = Probability of selection of the plot in segment h
 g_{hi} = Number of grid squares selected in the i-th sample segment of stratum h;
 A_{hij} = Area of the j-th sample plot selected in the i-th sample segment of stratum h
 A_{hi} = Area of the i-th sample segment of stratum h;
 g_{hij} = Number of selected grid squares in the j-th sample plot of the i-th sample segment of stratum h

The weight of a sample plot is equal to the inverse of the first and second stage probabilities of selection:

$$W_{Phij} = \frac{1}{p_{1h} \times p_{2hi}} = \frac{N_h \times A_{hi} \times g_{hij}}{n_h \times g_{hi} \times A_{hij}}$$

Where:

- W_{Phij} = weight for the j-th sample plot in the i-th sample segment in stratum h

2.1.6. Sampling errors computation

The sample survey results can be subject to two types of errors: (i) sampling errors and (ii) non-sampling errors. Non-sampling errors encompass all sources of errors unrelated to sampling, occurring throughout all aspects of the survey process during data collection and processing. They are categorized into four types: coverage errors, measurement errors, non-response errors, and processing errors. While researchers take steps to minimize these errors during the survey design and implementation phases, it's practically impossible to eliminate them. Non-sampling errors, in particular, can be extremely challenging to identify and quantify accurately. Despite our best efforts, there's always some degree of uncertainty associated with survey results due to the presence of these errors.

Sampling errors are associated with the sampling selection process, arising from observing a sample instead of the entire population. They denote the disparity between the estimate derived from a sample survey and the true value that would result if a census of the whole population were conducted under the same conditions.

In order to examine the precision of the most important estimates from the SAS 2024 data and the statistical efficiency of the agricultural area frame and sample design, it is important to calculate the sampling errors and corresponding coefficients of variation (CVs) for these estimates, such as the total area in each major crop. The sampling error of each estimate is measured by the standard error, which is the square root of the variance. The Complex Samples module of SPSS and Stata use a linearized Taylor series variance estimator that considers the stratification and clustering in the sample design.

The SPSS Complex Samples software had been used to calculate the sampling errors and CVs for estimates of the total area of major crops from the SAS data.

The formula for the estimate of a total can be expressed as follows:

$$\hat{Y} = \sum_{h=1}^L \sum_{i=1}^{n_h} \sum_{j=1}^{m_{hi}} W'_{hi} y_{hij} ,$$

Where:

L = number of strata

y_{hij} = value of variable y for the j -th sample household in the i -th sample segment in stratum h

The variance estimator for a total used by the Complex Samples module of SPSS and Stata can be expressed as follows:

$$V(\hat{Y}) = \sum_{h=1}^L \left[\frac{n_h}{n_h - 1} \times \sum_{i=1}^{n_h} \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right)^2 \right],$$

Variance Estimator for a Total

Where:

$$\hat{Y}_{hi} = \sum_{j=1}^{m_h} W'_{hi} y_{hij}$$

y_{hij} = value of variable y for the j -th sample plot in the i -th sample segment of stratum h

$$\hat{Y}_h = \sum_{i=1}^{n_h} \hat{Y}_{hi}$$

The survey estimate of a ratio is defined as follows:

$$\hat{R} = \frac{\hat{Y}}{\hat{X}},$$

where \hat{Y} and \hat{X} are estimates of totals for variables y and x , respectively, calculated as specified previously.

In the case of a stratified two-stage sample design, means and proportions are special types of ratios. In the case of the mean, the variable X , in the denominator of the ratio, is defined to equal 1 for each unit so that the denominator is the sum of the weights. For a proportion, the variable X in the denominator is also defined to equal 1 for all units; the variable Y in the numerator is binomial and is defined to equal either 0 or 1, depending on the absence or presence, respectively, of a specified characteristic for the unit.

The variance estimator for a ratio used by SPSS Complex Samples and Stata can be expressed as follows:

Variance Estimator for a Total

$$V(\hat{Y}) = \sum_{h=1}^L \left[(1 - f_h) \times \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right)^2 \right],$$

Where:

f_h = first stage probability for stratum h ; $(1 - f_h)$ is the finite population correction (fpc) factor

$$\hat{Y}_{hi} = \sum_{j=1}^{m_h} W'_{hi} y_{hij}$$

y_{hij} = value of variable y for the j-th sample plot in the i-th sample segment of stratum h

$$\hat{Y}_h = \sum_{i \neq h}^{n_h} \hat{Y}_h$$

Variance Estimator for a Ratio

$$V(\hat{R}) = \frac{I}{\hat{X}^2} [V(\hat{Y}) + \hat{R}^2 V(\hat{X}) - 2 \hat{R} COV(\hat{X}, \hat{Y})],$$

$$\text{Where: } COV(\hat{X}, \hat{Y}) = \sum_{h \neq L}^L \left[(1 - f_h) \times \frac{n_h}{n_h - I} \sum_{i \neq h}^{m_h} \left(\hat{X}_h - \frac{\hat{X}_h}{n_h} \right) \left(\hat{Y}_h - \frac{\hat{Y}_h}{n_h} \right) \right]$$

$V(\hat{Y})$ and $V(\hat{X})$ are calculated according to the formula for the variance of a total.

In addition to calculating the standard error, the program also computes the Design Effect (DEFF) for the main indicator, which is the area under cultivation. The Design Effect is defined as the variance of an estimate based on the actual complex sample design divided by the corresponding variance from a simple random sample of the same size. It serves as a measure of the relative statistical efficiency of the sample design, taking into account both the stratification and clustering present in the sample design.

The presence of clustering typically increases the design effect, owing to the intra-cluster correlation of plots within the segments. Simultaneously, the land-use stratification of the segments tends to decrease the design effects, as it proves to be more efficient than a simple random sample. This dual consideration of both factors provides a comprehensive assessment of the efficiency of the sample design in capturing the nuances of the area under cultivation. The estimates of the total area of major crops at the national level and the corresponding measures of precision (standard error (SE), the coefficient of variation (CV), the 95 percent confidence interval, the design effect (DEFF), and number of unweighted observation (n of sample plots)) from the SAS 2024 data are presented in Tables 76, 77 and 78 on the Annexes.

2.2. Data collection approach

2.2.1 Data collection procedures

SAS data collection is carried out into two distinct phases: the first phase, known as screening, is done during the planting period. It consists of delineating all plots containing the sampled points in all sampled segments all Large-Scale Farmers (LSF) who have grown crops in the current season and recording information related to agricultural land use, grown crops and crop area, and expected harvesting period for. The second phase involves collecting data in the agricultural plots identified during screening activity, which relates to crop production, agricultural inputs, and the agricultural practices.

2.2.2. Time frame and coverage

During the 2024 data collection for the Seasonal Agricultural Survey (SAS), the survey was conducted across all 30 districts of Rwanda. For Season A, data were collected from 1,200 segments and 370 large-scale farmers

between December 3, 2023, and March 28, 2024. Similarly, during Season B, data were gathered from 1,200 segments and 384 large-scale farmers, with the collection period spanning from April 21 to August 15, 2024. Additionally, data collection for Season C took place from September 8 to October 17, 2024, covering 946 segments identified as suitable for growing Season C crops. The survey achieved a 100% response rate, with complete coverage of all sampled segments. This included full participation from operators of the sampled plots and all large-scale farmers across all seasons.

2.2.3 Field staff

During this agricultural year, experienced fieldworkers conducted the field data collection following a comprehensive refresher training. In Season A, 155 enumerators and 29 team leaders were deployed, while 147 enumerators and 28 team leaders served in Season B and Season C involved 140 enumerators and 28 team leaders. To ensure the highest data quality, rigorous supervision was maintained throughout the data collection activities across all three seasons.

2.2.4 Data collection tools

Survey questionnaires

SAS utilizes two main questionnaires: The Screening questionnaire and the Plot interview questionnaire. The Screening Questionnaire is designed to gather information on the plot, focusing primarily on aspects such as land use, plot area, and the crops grown. On the other hand, the Plot Interview questionnaire is specifically designed to collect detailed information about the sampled plots, including crop production, agricultural inputs used, and agricultural practices applied.

Data collection applications

The SAS data collection applications were based on three main software applications:

- Arc GIS field map, which utilizes GIS software and external GPS linked to tablets via Bluetooth to accurately measure crop areas.
- CSPro software, known for its efficiency in census and survey administration, facilitating data collection, entry, and management processes. Csentry data collection tool has been developed by an IT staff specialized for the SAS survey, enabling data collection from sampled plots and large-scale farmers.
- Survey123 is used to collect screening data for large-scale farmers.

2.3. Data quality assurance

Data quality assurance is achieved through a comprehensive approach, involving enumerator training, continuous data monitoring, supervision of data collection activities, and data editing throughout the season.

2.3.1. Training of enumerators

Prior to data collection, enumerators underwent training at the start of each season. The training for Season A took place from November 13 to 30, 2024, for Season B from April 15 to 19, 2024, and for Season C from September 2 to 6, 2024. All training sessions were conducted at the NISR Training Center. The sessions covered an overview of the latest updates to the SAS, data collection procedures and ethics, screening protocols, the content of the plot interview questionnaire, and the use of data collection applications, including Survey 123, ArcGIS Field Map, and CSEntry.

2.3.2. Fieldwork monitoring

Monitoring attendance and performance of enumerators

Effective monitoring of enumerator attendance and performance is vital for ensuring task efficiency and contribution. The monitoring system used during 2024 SAS relies on capturing GPS metadata, including location and GPS time, which differs from the device time and cannot be modified by the user. Whenever the enumerator sent data to the server, the metadata accompanies it, enabling analysis of attendance (starting and ending time), location during data collection, and performance metrics such as the number of completed tasks.

Attending the sample location and Use of high precision GPS

The SAS collects data from observation points grouped into square segments of 300 by 300 meters. Enumerators were required to collect data within a one-meter distance buffer around each observation point, enforced to ensure accuracy. Any observation outside this buffer is marked as an error and rejected by the central database. To measure plot areas, high-precision GPS units are employed, along with correction services, achieving 95 percent sub-meter measurement accuracy and addressing precision challenges.

Field Monitoring Dashboard

A field monitoring dashboard used is an online web application offering a visual representation of real-time data collected from various field operations. It provides a centralized and accessible platform for monitoring and managing activities, resources, and performance in the field.

Field supervision

In the 2024, intensive field supervision was carried out to ensure data quality across all survey seasons. During Season A, the first field supervision visit, involving 25 NISR staff members, took place from December 10 to 24, 2023. Subsequently, during the harvesting phase from January 14 to 27, 2024, a team of 15 NISR staff conducted field supervision.

For Season B, the first supervision visit, comprising 30 NISR staff, was conducted from May 2 to 15, 2024. During the harvesting phase, from June 17 to 28, 2024, a team of 21 NISR staff participated in supervision activities. In Season C, the initial supervision visit, involving 23 NISR staff, occurred from September 15 to 21, 2024. During the harvesting phase, from October 8 to 14, 2024, a team of 24 NISR staff conducted field supervision.

Throughout all supervision phases, staff were deployed to every district to provide continuous oversight and support to field personnel. Their responsibilities included offering technical guidance, monitoring the implementation of data collection activities, ensuring adherence to data collection ethics, verifying the completeness of workloads, and addressing any challenges encountered in the field.

Data Editing

During the SAS 2024, a monitoring system involving the GIS tools and data editors was used to ensure quality assurance. The data collection is monitored using dashboard and Google Sheets. Editors conduct daily follow-ups to clean data, identifying and rectifying discrepancies using STATA do files based on logical patterns and feedback from training sessions, aiming to provide a cleaned raw dataset for further analysis.

2.4. Data processing and analysis process

The analysis involved several steps from organization of raw dataset, data management, cleaning, checking for outliers and dealing with missing data to ensure the quality and cleaned dataset before tabulation.

2.4.1. Data management process

SAS data are collected electronically using tablets and are then transmitted directly to the NISR servers. The data analyst team downloads and imports the data from CSPro into STATA software for further examination, including checking, cleaning, and tabulation.

Exploratory analysis of the dataset is conducted for all variables to assess the sample's completeness, identifying missing data or incomplete observations. Any identified cases are sent back to the field for verification and completion. Exploratory techniques such as descriptive statistics (summary statistics, frequency tables) and graphical methods (histograms, box plots, etc.) are employed to detect missing values, incomplete data, and potential abnormalities or outliers within the dataset.

2.4.2 Detecting outliers and dealing with missing values

Missing values and duplicates observation

During data collection, the CSPro application's built-in validation rules detect missing, omitted, or skipped variables. Error messages appear on the tablet's screen during interviews when enumerators skip questions that require responses. After completing the interview but before sending data to the servers, an error message notifies users if any questions have been left unanswered or if duplicate questionnaire IDs are identified.

Once data is downloaded and imported into STATA from the servers, the data analyst merges the area dataset with the crop dataset and conducts preliminary checks, cleaning, and necessary transformations before analysis. A do file is developed to check the completeness of data for screening and plot/harvest datasets.

A team of data analysts checks the data on a daily basis, and any inconsistencies found are communicated to field workers for correction and clarification.

Detecting and dealing with outliers

Outliers are checked for all quantitative variables, including crop production, fertilizer quantity, seed quantity, agricultural input prices, irrigation costs, and other related expenses. Two approaches are employed to detect outliers for variables such as crop production and input quantities, while a single approach is applicable for the remaining variables.

The first approach involves comparing the value per hectare of land to the standard quantity optimum provided in the guidelines from the Ministry of Agriculture, known as "AGENDA AGRICOLE," for the same land size. Any values found to be 1.5 times greater than the standard values are flagged as potential outliers and subsequently sent back to field workers for verification and confirmation.

The second approach utilizes statistical processes to detect outliers. In SAS, various statistical methods such as standard deviation and graphical methods like normal box plots are utilized in combination to identify possible outliers within the dataset.

2.4.5 Methods for Estimating Area and Yield

Estimation of area Approach

NISR adheres to and applies methodologies and guidelines outlined by (FAO, 2017) and (EAC, 2022) regarding area and yield estimation. Among several methods proposed, NISR has opted for the use of high precision GPS to measure crop area due to its high accuracy and efficiency compared to alternative methods. For yield measurement, NISR relies on farmer estimations.

Process of measuring the area

After the identification of the plot boundaries, the enumerators mark GPS points location in approximately every three meters and at each corner of the plot while moving around its perimeter. Then a polygon is obtained when the starting and final points connect. The area is finally computed automatically by GIS software linked to the enumerator's GPS and based on the resulting shape.

Process of measuring the yield

Yield data are calculated by considering both the plot and crop areas, alongside the crop production reported by the farmer within the sampled plot. This calculation involves dividing the total production, converted into kilograms, by the estimated crop areas measured in hectares.

Data Analysis

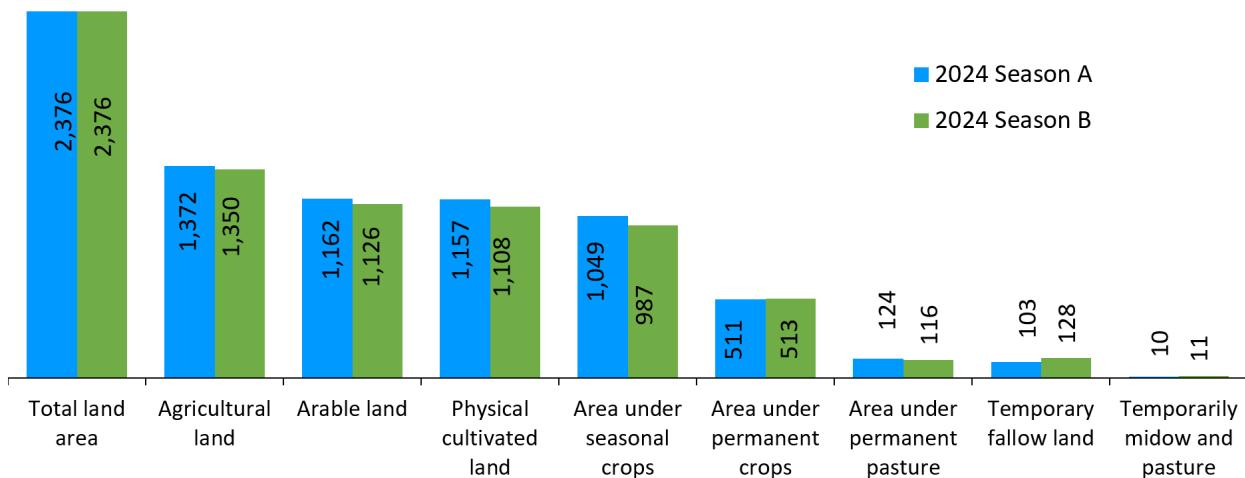

The survey data are analysed using STATA software, which offers robust capabilities for data management, including importing, cleaning, merging, and manipulating datasets. These features facilitate data preparation for analysis. Additionally, STATA enables the development of tabulation commands and the generation of survey tables, graphs, and charts for inclusion in survey reports. Furthermore, SPSS and STATA softwares are utilized for estimating survey sampling errors, ensuring the accuracy and reliability of the survey results.

SURVEY FINDINGS

This section highlights key results of SAS 2024 related to crop area (physical land use, cultivated area, and harvested area), yield, production, agricultural inputs, and agricultural practices in Rwanda.

3.1. Agricultural land use (,000Ha) for 2024 Season A and B

Figure 1: Agricultural land use for Season A and B 2024 (in thousands of hectares)

Source: NISR, SAS 2024

The total land area of the country is about 2.376 million hectares. For Season A, 1.372 million hectares (58% of the total land) is used for agriculture. Of this, 1 million hectares are planted with seasonal crops, 0.511 million hectares with permanent crops, and 0.124 million hectares are used for permanent pasture. In Season B, 1.350 million hectares (57% of the total land) is used for agriculture, including 0.987 million hectares for seasonal crops, 0.513 million hectares for permanent crops, and 0.116 million hectares for permanent pasture.

3.2. Crop area, production and yield for major crops

Maize:

- The cultivated area for maize in Season A 2024 was estimated at 249,435 hectares, an increase of 10 percent from season A of 2023. In season B 2024, the cultivated area for maize was estimated at 92,944 hectares, a decrease of 1 percent from season B of 2023.
- The production of maize in Season A 2024 was estimated at 507,985 metric tons, an increase of 30 percent from season A of 2023. In season B 2024, the production of maize was estimated at 119,101 metric tons, an increase of 1 percent from season B of 2023.
- The average yield of maize was 2 tons per hectare, with an average yield of 2 tons and 4.6 tons for small

scale farmers and large-scale farmers respectively in season A of 2024. In season B 2024, the national average maize yield was 1.3 tons per hectare, with an average yield of 1.2 tons and 4.3 tons for small scale farmers and large-scale farmers respectively (See Tables 10-23)

Beans:

- In Season A 2024 the cultivated area for beans was estimated at 329,001 hectares, an increase of 5 percent season A of 2023. In season B 2024, the cultivated area for beans was estimated at 329,112 hectares, an increase of 6 percent from season B of 2023. In season C 2024, the cultivated area for beans was 2,892 hectares, a decrease of 17 percent when compared to season C of 2023.
- The production of beans in Season A 2024 was estimated at 233,142 metric tons, an increase of 18 percent when compared to season A of 2023. In season B 2024, the production of beans was estimated at 242,239 metric tons, a decrease of 1 percent when compared to season B of 2023, while in season C 2024, the production of beans was estimated at 3,046 metric tons, a decrease of 13 percent when compared to the same season of 2023.
- The average yield of beans was 709 kilograms per hectare in season A, with an average yield of 709 per hectare for small scale farmers and 817 kilograms per hectare large-scale farmers. In season B, the average yield of beans was 737 kilograms per hectare, with an average of 737 kilograms per hectare for small scale farmers and 735 kilograms per hectare for large-scale farmers. In season C, the average yield was estimated at 1,054 kilograms per hectare. (see district details in Tables 10-23).

Paddy rice:

- The cultivated area for paddy rice in Season A 2024 was estimated at 17,173 hectares, an increase of 6 percent from season A of 2023. In season B 2024, the cultivated area for paddy rice was 17,994 hectares, an increase of 8 percent from season B of 2023.
- In Season A 2024, the production of paddy rice was estimated at 69,098 metric tons, an increase of 8 percent from season A of 2023. In season B 2024, the production of paddy rice was estimated 72,834 metric tons, an increase of 4 percent from season B of 2023.
- The average yield of paddy rice was 4.1 tons per hectare, in season A of 2024, with small scale farmers harvesting 2.6 tons per hectares and Large-Scale Farmers harvesting 4.1 tons per hectare. In season B 2024, the average yield of paddy rice was 4.1 tons per hectare, with small scale farmers harvesting 3.1 tons per hectares and Large-Scale Farmers harvesting 4.2 tons per hectare (See district details in Tables 10-23).

Irish potatoes:

- The cultivated area of Irish potatoes was estimated at 54,048 hectares in season A of 2024, a decrease of 3 percent when compared to the same season of 2023. In season B 2024, the cultivated area of Irish potatoes was estimated at 41,836 hectares, a decrease of 13 percent from season B of 2023. In season C 2024, the cultivated area under Irish potatoes was 8,846 hectares, a decrease of 16 percent when compared to the same season of 2023.
- The production of Irish potato was estimated at 460,830 metric tons in season A of 2024, an increase of 1 percent from season A of 2023. In season B 2024, the production of Irish potato was estimated at 285,596 metric tons, a decrease of 13 percent from season B of 2023. In season C 2024, the production of Irish potato was estimated at 80,929 metric tons, a decrease of 4 percent when compared to the same season in 2023.
- The average yield of Irish potato was 8.5 tons per hectare in season A of 2024, with small scale farmers harvesting 8.5 tons per hectares and Large-Scale Farmers harvesting 12.9 tons per hectare. In season B

2024, the average yield of Irish potato was 6.8 tons per hectare, with small scale farmers harvesting 6.8 tons per hectares and Large-Scale Farmers harvesting 14.9 tons per hectare. In season C, the average yield for Irish potatoes was estimated at 9.1 tons per hectare. (See district details in Tables 10-23).

Sweet potato:

- The cultivated area for sweet potato was 95,683 hectares in season A of 2024, a decrease of 10 percent from season A of 2023. In season B 2024, sweet potato cultivated area was 97,289 hectares, an increase of 1 percent from season B of 2023. In season C 2024, sweet potato cultivated area 4,429 hectares, an increase of 5 percent when compared to the same season of 2023.
- The production of sweet potato was estimated at 692,945 metric tons, an increase of 4 percent from season A of 2023. In season B, the production of sweet potato was estimated at 666,814 metric tons, an increase of 8 percent from season B of 2023. In season C, the production sweet potato was estimated at 38,293 hectares, an increase of 56 percent when compared to the same season of 2023.
- The average yield of sweet potato was 7.8 tons per hectares in season A of 2024, 7.7 tons per hectares in season B 2024 and 8.6 tons per hectares in season C (See district details in Tables 10-23).

Cassava:

- The cultivated area for cassava was estimated at 251,019 hectares in season A of 2024, an increase of 5 percent from season A of 2023. In season B 2024, the cultivated area for cassava was estimated at 172,596 hectares, an increase of 8 percent from season B of 2023.
- The harvested area was estimated at 38,833 hectares in season A of 2024 and 54,679 hectares in season B of 2024.
- The production of cassava in season A 2024 was 518,044 metric tons, a decrease of 15 percent when compared to season A of 2023. In season B 2024, the production of cassava was estimated at 783,294 metric tons, an increase of 6 percent when compared to season B of 2023.
- The average yield of cassava was 13.3 tons per hectare in season A of 2024 and 14.3 tons per hectare in season B of 2024. (See district details in Tables 10-23)

Banana:

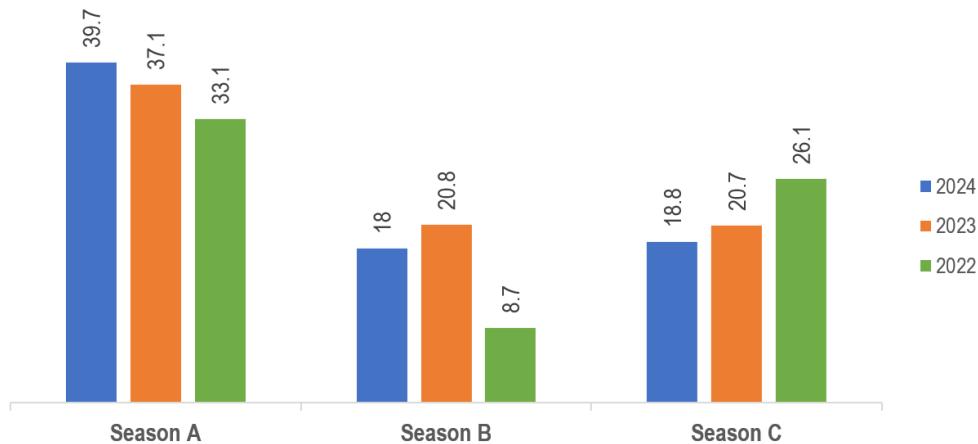

- The cultivated area for banana was estimated at 273,223 hectares in season A of 2024, an increase of 7 percent from season A of 2023. In the same season, the harvested area was estimated at 109,985 hectares. In season B 2024, the cultivated area for banana was estimated at 258,564 hectares, an increase of 0.2 percent from season B of 2023. In the same season, the harvested area was estimated at 92,501 hectares.
- The production of banana was estimated at 1,294,683 metric tons in season A of 2024, an increase of 6 percent when compared to 2023 season A. In season B 2024, the production of banana was estimated at 1,142,552 metric tons, an increase of 5 percent when compared to 2023 season B.
- The average yield of banana was 11.8 tons per hectare in season A 2024 and 12.4 tons per hectare in season B 2024 (See district details in Tables 10-23).

3.3. Agricultural inputs

This section highlights the use of agricultural inputs. Agricultural inputs include seeds, organic and inorganic fertilizers, and pesticides/fungicides. The survey results are presented in terms of percentage of farmers who applied such agricultural inputs throughout the agricultural year.

3.3.1. Use of seeds

Figure 2: Use of improved seeds (%)

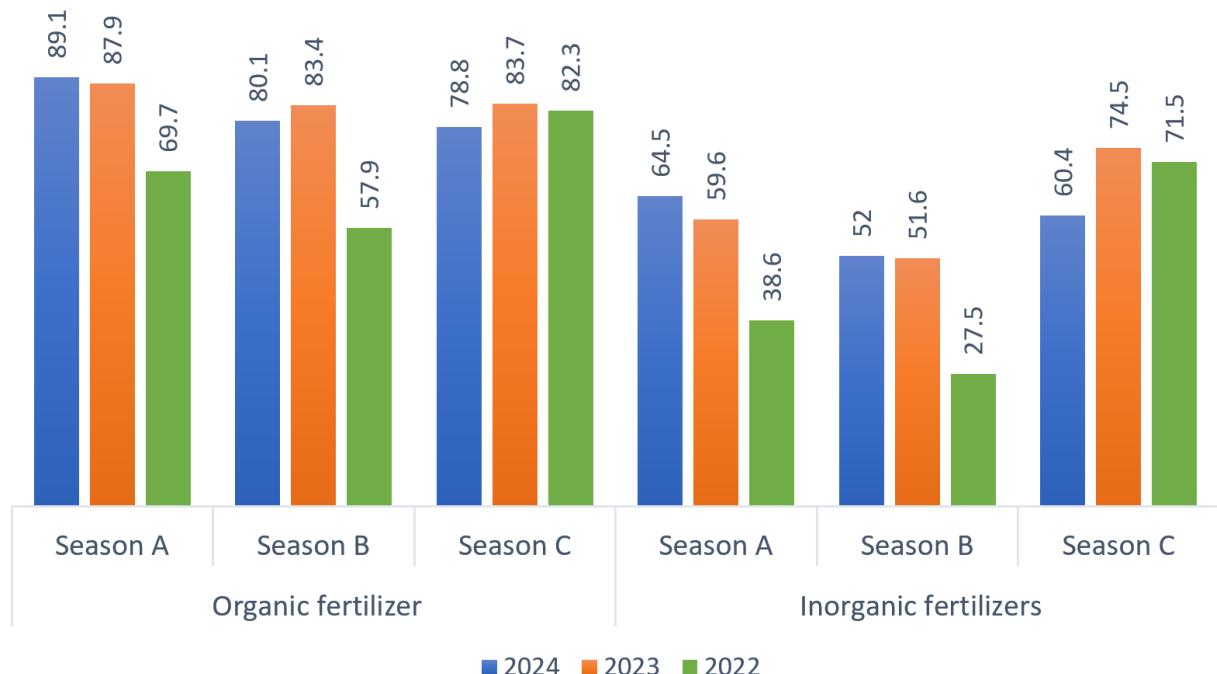

Source: NISR, SAS 2024

Figure 2 shows that 39.7 percent of farmers used improved seeds in season A of 2024 compared to 18 percent in season B, and 18.8 percent in season C. In terms of farmer categories, 38.4 percent of small-scale farmers (SSF) and 87.3 percent of large-scale farmers (LSF) used improved seeds in season A. In season B 2024, 16.6 percent of small-scale farmers and 72.6 percent of large-scale farmers used improved seeds. Agro-dealers and NGOs/companies were the primary sources for improved seeds across seasons of 2024. (See district details in table 30-39).

3.3.2. Use of fertilizers

Figure 3: Percentage of farmers who used fertilizers.

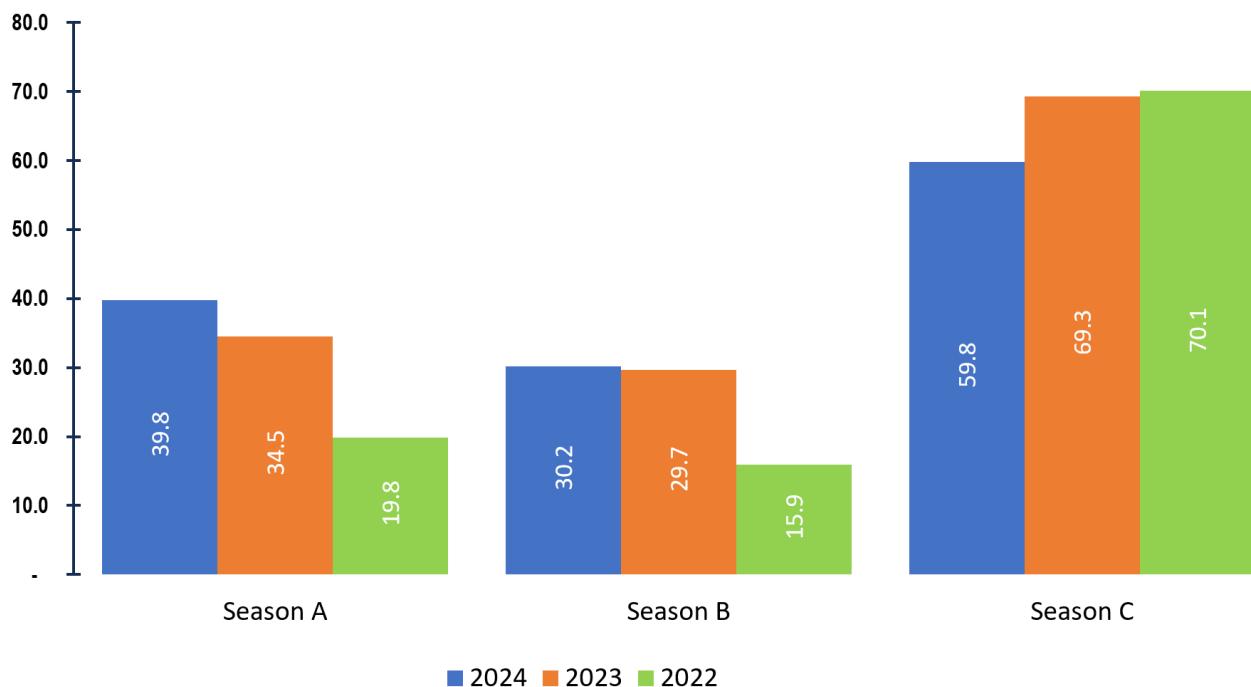

Source: NISR, SAS 2024

In season A of 2024, 89.1 percent of farmers used organic fertilizers, with 89.5 percent of small-scale farmers and 76.4 percent of large-scale farmers. In season B 2024, 80.1 percent of farmers used organic fertilizers, with 80.5 percent of small-scale farmers and 64.9 percent of large-scale farmers, whereas 78.8 percent of farmers used organic fertilizers in season C of 2024.

In regard to inorganic fertilizers, in season A of 2024, 64.5 percent of farmers used inorganic fertilizers with 63.8 percent of small-scale farmers and 90.8 percent of large-scale farmers. In season B 2024, 52 percent of farmers used inorganic fertilizers with 51.2 percent of small-scale farmers and 82.9 percent of large-scale farmers, whereas 60.4 percent of farmers used inorganic fertilizers in season C of 2024 (See district details in table 40-54)

3.3.3. Use of pesticides

Figure 4: Percentage of farmers who used pesticides

Source: NISR, SAS 2024

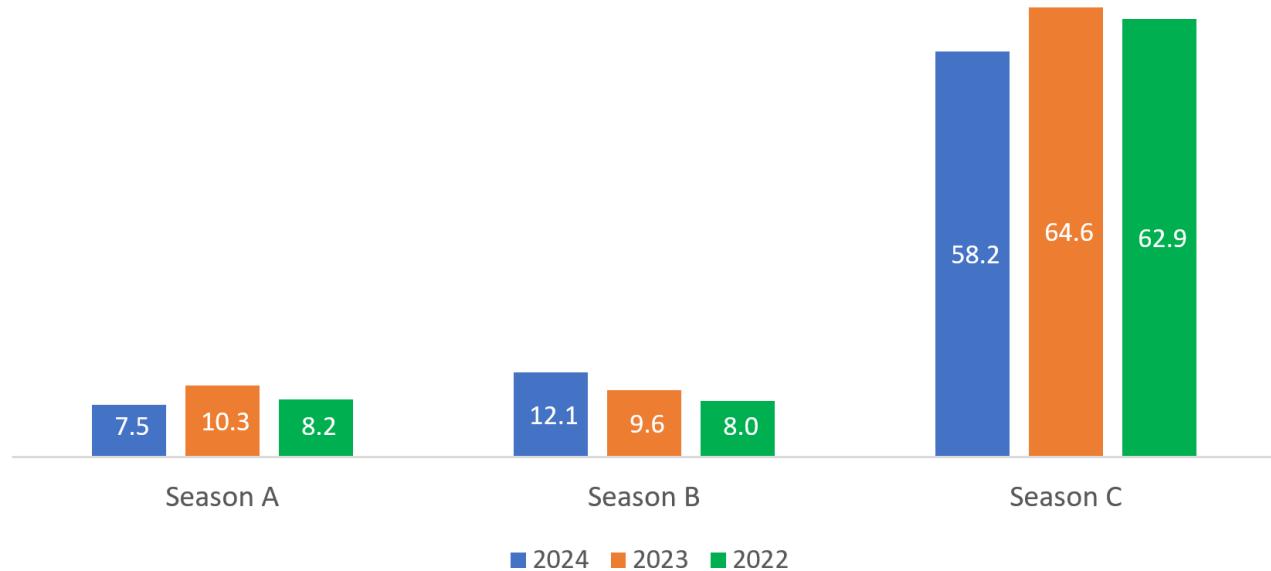

In Season A of 2024, 39.8% of farmers applied pesticides, including 38.6% of small-scale farmers and 82.9% of large-scale farmers. In Season B 2024, pesticide usage decreased to 30.2% of farmers, with 29.1% of small-scale farmers and 74.9% of large-scale farmers using pesticides. Pesticide usage was highest in Season C 2024, with 59.8% of farmers applying them (see details in Tables 55–60).

3.4. Agricultural practices

Agricultural practices assessed include irrigation, mechanisation, erosion control measures and agroforestry adopted by farmers during the SAS 2024. The results are presented in terms of the percentage of farmers who applied such practices.

3.4.1.Irrigation practices

Figure 5: Farmers who practiced irrigation (%)

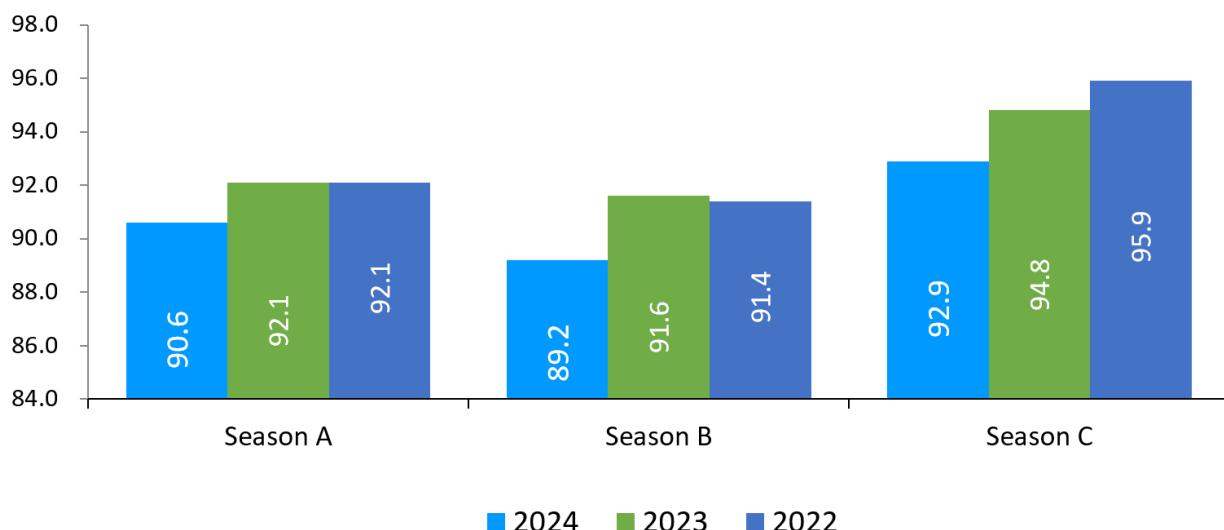

Source: NISR, SAS 2024

In season A of 2024, 7.5 percent of farmers practiced irrigation, compared to 12.1 percent of farmers in season B and 58.2 in season C. During season A, irrigation was practiced by 6.4 percent of small-scale farmers and 48 percent for large-scale farmers, while in season B, irrigation was practiced by 10.8 percent of small-scale farmers and 67 percent for large-scale farmers. In terms of irrigation types, 57percent practiced the modern irrigation in season A, 62.9 percent in season B while traditional techniques were predominantly used during season C with 77.1 percent (See details in Tables 61-72)

3.4.2.Erosion control measures

Figure 6: Farmers who protected land against erosion (%)

Source: NISR, SAS 2024

In Season A of 2024, 90.6% of farmers applied anti-erosion activities, compared to 89.2% in Season B and 92.9% in Season C. Cover plants were the most commonly used anti-erosion method across all seasons of 2024, adopted by 60.3% of farmers in Season A, 61.5% in Season B, and 40.7% in Season C. Additionally, 45.6% of farmers practiced agroforestry in Season A, rising to 47% in Season B but dropping to 25.9% in Season C of 2024. The use of mechanical equipment in agricultural activities remained minimal in 2024, with 1% of farmers in Season A, 0.8% in Season B, and 0.3% in Season C utilizing it (see details in Tables 61–72).

3.5. Gross Value Added (GVA)

The Gross Value-Added value of different crops is shown in constant 2017 prices. Results show the Gross Value Added per hectare for crops such as Maize, Paddy rice, Irish potato, Beans, Pea and Soybean, have increased in 2024 compared to 2023.

Table 5: Main crops GVA in constant 2017 prices (Frw /ha)

Crops								2024
	2017	2018	2019	2020	2021	2022	2023	
Maize	309,457	365,527	373,066	389,059	387,754	390,303	407,284	468,156
Sorghum	296,000	298,689	274,485	280,068	299,996	302,122	323,073	337,745
Paddy rice	1,633,520	1,492,544	1,718,397	1,691,890	1,799,480	1,799,248	1,757,086	1,764,837
Wheat	282,068	306,210	329,278	289,132	303,795	321,878	348,790	353,248
Cassava	305,145	1,377,459	1,629,739	1,642,935	1,653,322	1,648,255	1,597,292	1,566,447

ANNEX

Annex 1: Concepts, definitions, and estimation methods

1. Total land area

Total land area at district level is the district area excluding area under inland water bodies. The definition of inland water bodies generally includes major rivers and lakes.

2. Agricultural area

The agricultural area includes arable land, land under permanent² crops and permanent pasture.

3. Arable land

Arable land includes land defined by the FAO as land under temporary crops (double-cropped areas are counted only once), temporary meadows for mowing or pasture, land under market and kitchen gardens and land temporarily fallow (less than five years). The abandoned land resulting from shifting cultivation is not included in this category. Data for arable land are not meant to indicate the amount of land that is potentially cultivable.

4. Permanent crop land

Permanent crops are sown or planted once and occupy the land for some years and do not need to be replanted after each annual harvest, such as cocoa, coffee and rubber. This category includes flowering shrubs, fruit trees, nut trees and vines, but excludes trees grown for wood or timber. The following crops are considered as permanent crops in SAS: Cooking banana, Dessert banana, Banana for beer, Avocado, Coffee, Sugar cane, Macadamia, Olive, Mango, Apple, Papaya, Orange, Lemon, Guava, Mulberry, Stevia, Jatropha, Palm, and Tea.

5. Permanent pasture land

Land used permanently (five years or more) for herbaceous forage crops, either cultivated or growing wild (wild prairie or grazing land).

6. Irrigated agricultural land

Area equipped for irrigation, which is actually irrigated, (sometimes expressed as a percentage of the total land area). Part of the area equipped for irrigation refers to area equipped to provide water to crops and includes areas equipped for full/partial control irrigation, equipped lowland areas, and areas equipped for spate irrigation. Part of the area equipped for irrigation which is irrigated refers to physical areas. Irrigated land that is cultivated more than once a year is counted only once.

² For some plots, permanent crops are mixed with temporary crops which mean that same area is counted in both arable land area and area under permanent crop.

7. Physical area

Physical area refers to the total area of the plot as physically measured. The physical agricultural area in a district is estimated by aggregating all weighted individual agricultural plots area for that district.

8. Crop area (cultivated area)

Crop area refers to the area occupied by a given crop in a plot considering its density or occupation. In context of Rwanda as well as many African countries, mixed cropping system is a general practice in agriculture. This practice makes it complex to estimate area under crop cultivation. In case of pure stands (for crop completely covering a plot), crop area is equal or less to physical plot area (if a crop is partially covering the plot, the share is estimated then applied to the plot area). In case of mixed crops, the share of each crop in the plot is estimated by enumerator by eye estimation method and applied to the physical area of the plot to obtain area for each specific crop planted in plot. In this context, the crop share is eye estimation of crop density or occupation in a plot (in %) basing on spacing between plants. Cultivated area at district level is equal to the total weighted crop areas within plots in the whole district.

Examples

- In case of pure stands, crop area will be equal to the physical area if the crop entirely covers the whole plot. Otherwise, the crop area will be less than physical area. For example, a plot of 1 hectare in which maize was grown and completely occupies the whole plot (100 % occupied), it means that cultivated area for maize is 1 hectare. On the other side let us assume that the maize crop occupies 80 % of the total plot area. In that case the area of maize equals 0.8 hectares (1hectare times 0.8).
- In case of mixed cropping system, specifically seasonal crops the crop area is less than physical area. For example, a plot of 1 hectare grown with maize and beans which occupies 60 % and 40 % of total plot area respectively. The maize area will be 0.6 hectare (1hectare times 0.6), and beans area will be 0.4(1hectare times 0.4). It is important to note that sum of shares of seasonal crops do not exceed one hundred percent.
- When seasonal and perennial crops are mixed in same plot, since perennial crops are permanent crops in nature, their shares are treated separately from seasonal crops. The sum of seasonal crops share does not exceed 100 %, while for perennial crops shares are given based on density (spacing between trees) and it may exceed 100 percent. For example, a plot of 1 hectare grown with maize, bean, and cassava with 60 %, 40 % and 50% shares respectively. Maize area will be 0.6 hectare (1hectare times 0.6), beans area will be 0.4(1hectare times 0.4), while cassava area will be 0.5 hectare (1hectare times 0.5).

9. Developed area

Developed area is the land covered by crops. Due to mixed cropping (over exploitation of agriculture land or under exploitation in case pure cropping), developed area can be less or greater than the physical area. Basing on the example provided above of the plot in which maize, beans and cassava have been mixed, maize has 0.6, beans have 0.4 while cassava has 0.5 ha. The developed area equals the sum of the crops area equivalent to 1.5 ha.

10. Harvested area

Area harvested is defined as the total number of hectares for all crops that is harvested in a given agriculture season. In case of crops considered as seasonal, the harvested area is assumed to be equal to the cultivated area. For perennial crops a farmer can decide to harvest a portion of land and stores the remaining production

in the farm or harvest the whole plot for commercial or other purposes. In this case, the proportion of harvested area is estimated and applied to the plot area to obtain actual harvested area. For example, cassava which occupies 0.5 hectare has 5,000 trees of cassava. In agriculture Season B, if the farmer only harvested 1,250 trees. In this case, the farmer harvested only a quarter (0.125hectares) of the cultivated area.

11. Crop yield

Crop yield is defined as total reported quantity of harvested crop over the harvested area of that crop.

12. Crop production

Crop production is the product of crop yield and crop area (harvested). At district level, crop production is estimated by taking crop yield of crop produce times total harvested area in the district.

Climbing bean	122,000	4,529	0.037	113,112	130,887	2.726	3,229
Pea	8,248	761	0.092	6,755	9,741	1.262	340
Groundnut	21,085	1,424	0.068	18,292	23,879	1.567	778
Cooking banana	90,123	3,668	0.041	82,927	97,320	1.363	3,621
Dessert banana	48,809	1,911	0.039	45,059	52,558	1.599	3,547
Banana for beer	119,632	4,166	0.035	111,458	127,806	1.336	3,941

Table 78 :Sampling Errors for major crops at the national level Season C 2024 data

Crop name	Estimate	SE	CV	95% Confidence Interval		DEFF	No. observations (plots)
				Lower	Upper		
Sweet potato	4,429	333	0.075	3,775	5,084	1.852	634
Irish potato	8,846	1,228	0.139	6,433	11,259	2.835	362
Bush bean	2,734	356	0.130	2,034	3,434	1.139	267
Pea	527	159	0.301	215	839	3.888	63
Soybean	576	214	0.371	157	996	2.309	67
Vegetables	5,738	536	0.093	4,685	6,792	0.451	594

Annex 3: SEASONAL AGRICULTURE SURVEY Report Contributors

National Coordinators

- MURENZI Ivan, Director General
- NDAKIZE RUGAMBWA Michel, Acting Deputy Director General

Technical coordination

- SIBOMANA Oscar, Acting Director of Economic Statistics Department
- MWIZERWA Jean Claude, Economic Statistics Project Manager
- BIGIRIMANA Florent, Census Program Manager
- DUSINGIZIMANA Emmanuel, Agriculture and Environmental Statistician Team Leader
- NIYITEGEKA Beata, GIS Team Leader

Field work coordination

- KAMANZI SHINGIRO Jean Philbert, SAS Specialist
- MUKAMAZIMPAKA Francine, Perennial crops and horticulture statistician

Data analysis

- ABAYISENGA Aimable, SAS Specialist
- MUVUNYI ISSA, Agricultural Survey Specialist
- RWAYITARE Jean Bosco, SAS Specialist
- MUREBWAYIRE Divine, SAS Specialist
- USABYIMANA Monique, Forestry and Environmental Statistician

GIS

- NIYITEGEKA Beata, GIS Team Leader
- BIZIMUNGU Clément, Field operations Cartographer Officer
- KARERA Albert, Geometrician in charge of map design & production
- IRAMBONA Eddy Marcus, GIS Specialist
- MUNDERERE Theophile, GIS Specialist
- NDAZIGARUYE Alfred, GIS Support Staff
- NGABO MUHIRE Olympe, GIS Support Staff

Data processing

- SEBAHIRE Jean Népomuscène, Food Security & Agriculture Surveys Data Processing Officer
- NIYIGENA Eric, Application Admin and Data Processing Officer

Data collection and Supervision

- We recognize all efforts of fieldworkers and Supervisors

Report writing and editing

- RWAYITARE Jean Bosco, SAS Specialist

Layout, typesetting and design

- UWAMUNGU Thierry, Publication Specialist
