

REPUBLIC OF RWANDA

NATIONAL INSTITUTE OF STATISTICS OF RWANDA

EICV3 DISTRICT PROFILE

West - Rutsiro

Foreword

The 2010/11 Integrated Household Living Conditions Survey (EICV3) is the third in the series of surveys which started in 2000/01 and is designed to monitor poverty and living conditions. The survey fieldwork commenced in November 2010 and continued for one full year. In 2010/11, for the first time the achieved sample size of 14,308 households in the EICV3 was sufficient to provide estimates which are reliable at the level of the district.

To date, twelve publications have been issued by the National Institute of Statistics Rwanda (NISR) using EICV3 data:

- A report with an overview of main indicators;
- A poverty profile;
- A series of ten thematic reports, each exploring in depth a theme from the Economic Development and Poverty Reduction Strategy (EDPRS). The ten reports in this series are:

(i) Economic Activity; (ii) Utilities and Amenities (water/sanitation/energy/housing/transport/ Information and Communication Technology (ICT)); (iii) Social Protection; (iv) Environment and Natural Resources; (v) Consumption; (vi) Gender; (vii) Youth; (viii) Education, (ix) Agriculture; and (x) Income.

This district profile is one of 30 further documents issued by the NISR. Based on EICV3 data, each district profile discusses the living conditions in one of the 30 districts of Rwanda.

Yusuf MURANGWA
Director General

NOTES

Acknowledgements

This report has been prepared with participation of a large number of individuals and organizations. We would like to express our gratitude to all of them.

We would like to express our sincere appreciation to the partner Ministries, Institutions, agencies and development partners for their respective great support and inputs throughout the process of writing and publishing this report.

We also express our profound gratitude to the team of Oxford Policy Management (OPM), and in particular to Mary Strode and her colleagues. Their technical assistance contributed to the success of this report.

We also thank the technical staff from National Institute of Statistics of Rwanda (NISR) for their unfailing participation in all activities of the survey data analysis, which was coordinated by HABIMANA Dominique and his assistants, APPEL Derek and KARANGWA John.

We appreciate the valuable support provided by administrative and financial departments of the NISR. Their interventions allowed this survey data analysis to be carried out smoothly and under good conditions.

1 Introduction

On 7 February 2012, the President of Rwanda officially launched the design phase of the EDPRS2. A key input into the development of the EDPRS2 is the evidence collected through the third Integrated Household Living Conditions Survey (EICV3), fieldwork for which was carried out by the NISR between October 2010 and November 2011. In 2010–11, for the first time the achieved sample size of 14,308 households in the EICV was sufficient to provide estimates which are reliable at the level of the district. This district profile presents the key findings from EICV3 for the district of Rutsiro in the Western Province.¹

This profile contains key baseline indicators for the district which are structured into eight sections as follows:

1. Demographic characteristics;
2. Poverty indicators;
3. Standards of living, which includes water and sanitation, housing and energy, ownership of selected durables, distance to facilities/services, and use of financial services;
4. Economic activities and income sources;
5. Agriculture, which includes land, farming practices, commercialisation of crop production, and livestock;
6. Education indicators covering schooling and literacy, primary and secondary education, and ICT education;
7. Vulnerable groups, including persons with major disabilities and orphans; and
8. Gender issues, including female heads of household and employment type by sex.

1 District tables underlying all figures in this report are presented in the Annex.

Figure 1.1 Western Province

2 Demographics

The estimated total population of Rutsiro district in 2010–2011, as provided by the EICV3 survey, is 326,000. This represents 13.7% of the total population of Western Province and 3% of the total population of Rwanda. Females comprise 52.4% of the population of Rutsiro district.

Figure 2.1 below clearly shows that the majority is young with 84.7% of the population aged under 40 years old; more than a half (56%) of the population are aged 19 or younger.

Figure 2.1 **Distribution of population in Rutsiro by age groups and sex (000s)**

Source: EICV3.

Figure 2.2 below presents the ratio of females per 100 males by district. It shows that females outnumber males in Rutsiro district with 110 females per 100 males, which is slightly below the national average of 111 females per 100 males.

Figure 2.2 Number of females per 100 males, by district

Source: EICV3. Note: Horizontal line represents national average.

As show in Figure 2.3 below, the average size of household in Rutsiro district is about 5 persons per household (4.7); this is slightly below the national average household size.

Figure 2.3 Mean household size, by district

Source: EICV3. Note: Horizontal line represents national average.

3 Poverty

The poverty line defines a level of household consumption per adult below which a household is deemed to be poor. The poverty line used here is set with reference to a minimum food consumption basket, which was judged to offer the required number of calories required for a Rwandan who was likely to be involved in physically demanding work, along with an allowance for non-food consumption. An extreme poverty line was also set as the cost of buying the food consumption basket if nothing was spent on non-food at all; this line corresponds to RWF 83,000 and the poverty line corresponds to RWF 118,000.

Figure 3.1 below presents the percentage of population classified into extremely poor, poor and non-poor. It shows that Rutsiro district is ranked ninth country-wide with a high percentage of extreme-poor and poor² population categories. In Rutsiro district 53% of the population is poor (including extreme-poor).

Only about 47% of the population in Rutsiro district is identified as non-poor, 27% as poor (excluding extreme-poor) and 26% as extreme-poor.

The poverty indicators for Rutsiro district are higher than the average for Western Province, which has 48.4% of poor population (including extreme poor). Within Western Province, Rutsiro is the third poorest district after Nyamasheke (63.4%) and Karongi (61.7%) districts.

Figure 3.1 Percentage of population identified as poor and extremely poor, by district

Source: EICV3. Note: Horizontal lines represent national averages of poverty and extreme poverty. Districts sorted by overall poverty level.

2 The poor category excludes extreme-poor.

The map presented in Figure 3.2 below also shows that Rutsiro district is among the districts with a high percentage of population identified as poor (between 40% and 55%).

Within Western Province, Rutsiro district is grouped with Ngororero (51.9%) and Rusizi (45%) districts.

Figure 3.2 **Map: Percentage of population identified as poor, by district**

4 Standard of living (utilities and amenities)

This section focuses on water and sanitation, energy and housing, ownership of selected durables, distance to facilities/services, and use of financial services. The Vision 2020, Rwanda's vision of its future development, identified the utilities and amenities discussed in this section as all being crucial requirements for Rwanda's social and economic development.

4.1 Water and sanitation

Improved drinking water source include protected springs, public standpipes, water piped into dwelling/yard, boreholes, protected wells and rainwater collection, as defined by the World Health Organisation (WHO).

The survey results shows that 60% households in Rutsiro district use an improved drinking water source. Figure 4.1 shows that half of households use a protected spring (50%), followed by a public standpipe (9%). However, 40% of households in this district still use an unimproved drinking water source.

Rutsiro district has not yet achieved the EDPRS national target for the water and sanitation sector, which is to increase access to drinking water to 85% by 2012. It lags behind the national target by 25 percentage points.

Figure 4.1 Main source of drinking water (percentage of households) in Rutsiro

Source: EICV3. Improved sources presented in blue, unimproved in red.

The map presented in Figure 4.2 below shows that Rutsiro district is among the three worst-performing districts by proportion of households using an improved drinking water source (40.3%–60%) in the country. It is grouped with Nyagatare (42.3%) and Ruhango (58.7%) districts.

Figure 4.2 **Map: Percentage of households using improved drinking water source, by district**

Figure 4.3 shows that, on average, only 30% of households in Rutsiro district are within 15 minutes' walking distance of an improved water source. Among all districts in the country, Rutsiro ranks fourth from bottom by the percentage of households within 15 minutes' walking distance of an improved water source, after Nyagatare (22.9%), Kirehe (24.3%) and Gisagara (26.8%) districts.

The mean time to an improved water source in Rutsiro district is 17 minutes, which is above the national average (14.4 minutes), meaning that improved water sources are further from household dwellings in Rutsiro than they are on average country-wide.

Figure 4.3 Percentage of households within 15 minutes' walking distance to improved water source, by district

Source: EICV3. Note: Horizontal line represents national average.

The WHO/UNICEF Joint Monitoring Programme defines an ‘improved sanitation facility’ as flush toilets and pit latrines with a floor slab.³

The map presented in Figure 4.4 presents the percentage of households with improved sanitation facilities by district. It shows that Rutsiro district has 63.4% of households with access to improved sanitation facilities, which is below the national average (74.4%).

The EDPRS target on sanitation is to have nationally 65% of the total population with hygienic sanitation by 2012. It is clear that Rutsiro district has not yet achieved this target.

Among the Western Province districts, Rutsiro is ranked last by percentage of households using improved sanitation; Ngororero district is ranked first in this province with 90%.

Figure 4.4 Map: Percentage of households using improved sanitation, by district

3 <http://www.wssinfo.org/definitions-methods/watsan-categories/>

4.2 Housing and energy

This section describes the housing and energy characteristics of the household. The habitat sub-sector has the main objective of contributing to sustainable economic growth and the wellbeing of the Rwandan population by improving habitat and urbanism infrastructure. The sub-sector engages in a programme to modernise cities in Rwanda, especially in the habitat areas, with interventions to curb the proliferation of unplanned housing and to improve living standards in irregular neighbourhoods.⁴

The guiding documents of the sub-sector are the Vision 2020 and the EDPRS. As summarised in the sub-sector's EDPRS Self-Assessment Report (2008–2011), the objectives of the Vision 2020 with regard to human settlement are summarised as follows:

- Having urbanisation master plans and particular development plans for towns;
- Using urban land according to adopted plans; and
- Developing basic infrastructure in urban areas and other rural development zones.

The objectives of the EDPRS with regard to human settlement and management of public property are worded as follows:

- Planning and development of improved human facilities in both rural and urban areas;
- Sustainable and rational use of land and environmental protection;
- Designing urban master plans;
- Construction of regrouped settlements (*Imidugudu*);
- 10,000 ha of marked-out and improved plots;
- Restructuring of seven districts where the population suffer from bad living conditions; and
- Accommodating public facilities into comfortable buildings in accordance with the need for rapid and quality services.

In order to achieve these objectives, the sector has stipulated specific sub-programmes to be focused on:

- Real estate promotion, construction and maintenance of public buildings;
- Registration of land plots with all necessary statutory requirements;
- *Imidugudu* promotion and development of master plans;
- Support for housing financing;
- Establishment of main planning, urban architectural designs and simplified plans of 30 municipalities (district towns);
- Improvement of informal/peripheral neighbourhoods;

4 Introduction to the habitat and urbanism sub-sector, MINIFRA (<http://www.mininfra.gov.rw/index.php?id=26>)

- Sensitisation on the standards of construction and urbanism as well as the protection of the urban environment; and
- Promotion of low cost and indigenous good materials and techniques for home building.

Energy is regarded as a key requirement for the development of the national economy and essential to the development of industries and businesses as well as to the delivery of high-quality services from social institutions such as health facilities, schools and administrative offices.

The EDPRS energy sector objectives are increasing access to energy, a sustainable tariff structure, diversification of energy resources, and security and strengthening of institutional framework and institutional capacity. Two main targets and indicators related to electricity generation capacity and numbers of electricity connections were defined for the period of the EDPRS.⁵

4.2.1 Dwelling characteristics

Figure 4.5 describes the construction material used for flooring by district. There are only 4.1% of households with cement floor, which is lower than the national average of 17%. Rutsiro is ranked last of all districts country-wide by percentage of households with a cement floor. 88.7% of households in Rutsiro district use beaten earth as their flooring material.

Figure 4.5 Percentage of households with cement floor, by district

Source: EICV3. Note: Horizontal line represents national average.

Figure 4.6 below presents the percentage of households with mud-covered tree trunks as their main wall material by district. The main wall material of dwellings were classified as follows: mud bricks, mud bricks covered with cement, tree trunks with mud, tree trunks with mud and cement, oven-fired brick, and other unspecified material.

In Rutsiro district, only 3.5% of households use mud-covered tree trunks as their wall material; this is followed by mud bricks covered with cement (10.4%) and mud bricks (85.4%). At national level, 35.2% of households use mud-covered tree trunks as their wall material, while the figure is 38.3% in rural areas.

Figure 4.6 Percentage of households with mud-covered tree trunks as wall material, by district

Source: EICV3. Note: Horizontal line represents national average.

4.2.2 Energy characteristics

The primary sources of energy used for lighting by households were categorised as follows: electricity, oil lamp, firewood, candle, lantern, battery, and other unspecified sources.

The map presented in Figure 4.7 presents the distribution of households using electricity as the main source of lighting by district. In Rutsiro district, only 0.4% of households use electricity as their main source of lighting, ranking the district second from bottom on this indicator among all districts of the country after Gisagara (0.3%).

On average, urban areas have 46.1% of households using electricity as their main source of lighting, while it is only 4.8% in rural areas and 10.8% at national level.

Figure 4.7 **Map: Percentage of households with electricity as main source of lighting, by district**

4.3 Ownership of selected durables

The EICV3 provides information on ownership of selected ICT devices by district and categorises them into mobile phone, landline phone, computer, radio, TV set, and video/DVD player.

When the Vision 2020 was elaborated in 1998/99, the national consultative process stated: ‘Telecommunication coverage in Rwanda is very low. The communication policy will take advantage of the small size of the country, its high population density and the single local language to attract investors so that the sector can be liberalised. By 2020, Rwanda projects to have internet access at all administrative levels, for all secondary schools and for a large number of primary schools. Telephone services will be widespread in rural areas’.

Ever since, the ICT sector has been regarded a key element of Rwanda’s development process. It is expected to create jobs, facilitate general economy development, and ensure that Rwanda will transform into a globally competitive, information-rich, knowledge-based economy.⁶

In line with these aspirations, the EDPRS/Common Performance Assessment Framework defines two sector-relevant progress indicators: ICT penetration in terms of voice (i.e. phone) and data (i.e. internet) services.

Figure 4.8 below describes the percentage of households owning a mobile phone by district. It shows that 35% of households in Rutsiro district own a mobile phone; this ranks the district third last among all districts of Western Province and seventh last at national level, below the national average as well as rural area average.

On average, 71.5% of households in urban areas own a mobile phone while in rural areas it is 40.6% and 45.2% country-wide.

Figure 4.8 Percentage of households owning mobile phone, by district

Source: EICV3.

6 ICT Sector EDPRS Self-Assessment Report, Ministry of Information and Communications Technology, December 2011.

Figure 4.9 below describes the percentage of households owning a radio by district. EICV3 results shows that 52% of households in Rutsiro district own a radio. The national average for households owning a radio is 60.3% while in urban areas it is 57.7% and in rural areas 60.7%.

Rutsiro is below the national average percentage of households owning a radio and is ranked third last among all districts of the country (Figure 4.9) after Karongi (48.3%) and Rubavu (45.9%). The district with the highest percentage of households owning a radio is Nyagatare district with 69.5%.

Figure 4.9 Percentage of households owning radio set, by district

Source: EICV3. Note: Horizontal line represents national average.

The map presented in Figure 4.11 below shows the mean walking distance to a health centre by district. The mean walking distance to a health centre in Rutsiro district is 69 minutes and only 35.4% of households walk for under than an hour on average to reach a health centre.

The mean walking distance to a health centre is 35 minutes in urban areas and 64.4 minutes in rural areas, while it is one hour country-wide.

Figure 4.11 **Map: Mean walking distance to basic services (in minutes): Health centre, by district**

4.5 Use of financial services

Figure 4.12 below presents the percentage of households with at least one saving account by district. It shows that 35% of households in Rutsiro district have at least one saving account, ranking the district seventh last of all districts in Rwanda. This is below the national average of 39.4% of households with at least one saving account.

At the sub-national level, 60.4% of urban households have at least one saving account; the figure is 35.8% in rural areas. Apart from Kigali City, which has the highest percentage of households with at least one saving account, the predominantly rural provinces vary between 33.8% and 40.1%.

Figure 4.12 Percentage of households with at least one savings account, by district

Source: EICV3. Note: Horizontal line represents national average.

5 Economic activity and income sources

5.1 Economic activity

This section refers to the population aged 16 years and above, as 16 years is the legal working age in Rwanda. Employment questions were asked of all individuals aged six years and above but only data for those aged 16 years and above appear in this section. It should be noted that the survey collected data about all the jobs people did over a 12-month period, as well as about those they did in the last seven days. We refer to the former as usual economic activity and to the latter as current economic activity.

The formal International Labour Organisation (ILO) definition of unemployment is those people who work under one hour per week but are actively seeking work and able to start immediately. In many low-income countries that do not have social safety nets, formal unemployment is quite low because it is rare to be able to afford to do no work at all. We present here statistics for formal unemployment and an estimate for the small number of discouraged workers. We also look at broader measures such as underemployment, which consist of those working part time, but who would like to work more hours a week.

Figure 5.1 below presents the percentage distribution of usual employment, unemployment, and economic inactivity among persons aged 16 years and above by district.

In Rutsiro district, the overall employment rate is 86% of the resident population aged 16 years and above; the economic inactivity rate is 14%. As shown in Figure 5.1 below, the Rutsiro district employment rate is above the national average. Among Western Province districts, Rutsiro is ranked second by employment rate after Ngororero district (92.7%).

The national average employment rate is 84%, the unemployment rate is 0.9% and the economic inactivity rate is 15%.

Figure 5.1 **Economic activity: Employment, unemployment, and economic inactivity among persons aged 16 and above (usual), by district**

Source: EICV3. Note: Based on all persons aged 16 and above. Horizontal line represents national average of employment rate.

Figure 5.2 presents employment types by usual main job in Rutsiro district. It shows that most people aged 16 years and above this district have *independent farmer* as their main job (63%). The second most frequent main job is *wage-farm* (14%), followed by *wage non-farm* (13%) and *independent non-farm* with (8%).

Figure 5.2 Employment types (usual main job) in Rutsiro

Source: EICV3. Note: Based on all persons aged 16 and above usually working.

Figure 5.3 below presents the industry of usual main jobs in Rutsiro district. It shows that most of the population aged 16 and above has Agriculture as the main industry (78%), followed by Trade (8%). All other industries for usual main job have figures of under 3% each.

Figure 5.3 Industry of usual main jobs in Rutsiro

Source: EICV3. Note: Based on all persons aged 16 and above usually working.

Figure 5.4 below presents the percentage of underemployed people – meaning the percentage of working people that worked 35 hours or fewer in all their jobs in the previous seven days – by district. Taking all the jobs that people did in the seven days before the survey we can start to understand underemployment. People whose main job is a waged job work on average 45 hours per week in all of their jobs (though this type of job holder is the least likely to be involved in more than one job). Those who work in small businesses as owners work 36 hours a week. Those who work as independent farmers work just 24 hours per week in all jobs, and waged farm workers work just 29 hours. People working on farms are the most likely to be working in more than one job at a time.

Setting a definition of underemployment at 35 hours a week or fewer, two-thirds of Rwandese adults can be defined as underemployed. Those working in farm jobs are the most likely to be underemployed, although it should be noted that farm workers must spend more time on gathering fodder for animals, fetching water and firewood, and marketing produce, which is not here counted as economic activity.

Only Kigali City has a significant percentage of the population working more than 35 hours a week, which is related to the higher than average proportion of jobs in Kigali that are non-farm paid work.

In Rutsiro district, 69.6% of adults 16 years and above worked 35 hours or fewer in all their jobs in the seven days prior to survey data collection and are classified as underemployed.

Figure 5.4 Underemployment (percentage of working people that worked 35 hours or fewer in all their jobs in the previous seven days), by district

Source: EICV3. Note: Based on all adults aged 16 years and above who worked in the previous seven days, and gave the numbers of hours worked in all their jobs. Horizontal line represents national average.

Figure 5.5 below describes the median number of hours spent in the last seven days on domestic duties by men and women by district. All persons were asked how many hours they spent on domestic duties. Fetching water, fodder and firewood are officially classed as economic activity according to the ILO.

The median number of hours spent on all domestic duties in the last seven days of the survey data collection in Rutsiro district, by all persons aged 16 and above, including working and non-working persons, is 26 hours where males spent 13 hours and females 36 hours; all these figures are above the national average. The national median number of hours spent by females on all domestic duties is 26 hours while males spent nine hours, together making a national average of 19 hours.

Country-wide, Rutsiro is ranked first by the median number of hours persons aged 16 and above, including working and non-working persons, spent on all domestic duties.

Figure 5.5 Median number of hours spent in last seven days on domestic duties by men and women, by district

Source: EICV3. Note: Domestic duties include foraging for firewood, fodder searching, water fetching, going to the market, cooking, and other household chores. Fetching water, fodder and firewood are officially classed as economic activity according to the ILO. Estimates based on all adults aged 16 years and above (both working and non-working). Horizontal lines represent the national average of median hours spent on domestic duties by men (lower line) and women (upper line). Districts are ordered by the median number of hours spent on domestic duties by women.

5.2 Income sources

This section focuses on five main components of income: agricultural income, wage income, business income, rent income, and income from transfers.

- Household agricultural income: this component is first divided into agricultural income (income from land cultivation) and livestock income. Unless otherwise specified, this report sums the two components into one agricultural component. It includes revenues from sale of crops, processed crop products, livestock products and other agricultural products, own consumption of food and non-food products, and the revenues from renting out livestock and sale of small animals. The income aggregate deducts costs on crop inputs, inputs used for processing crop products, and expenditure on livestock and the cost of renting land. Within the costs, the income aggregate includes the depreciation of land and agricultural equipment. The depreciation rate is equal to 0.2 per annum.
- Wage income: this includes cash and in-kind revenues received from farm and non-farm work. In-kind payments include food and other agricultural products, provision of house and other benefits received for the work.
- Non-farm self-employment (business): this includes income received net of labour and other inputs.
- Income from rents: this includes actual rents received from renting out livestock, agricultural equipment and land (rent and sharecropping), as well as imputed rental value of owner-occupied dwellings.
- Transfers: transfers include remittances received (cash and in-kind) and other private transfers. It also includes public transfers. Private transfers received from dowry and sales of assets and land are excluded.

All income values are in real terms, with the price index equal to 100 in January 2011. The price deflator used here to express values in real terms is the same one that was used in the poverty analysis. The price index is based on a general basket of goods including food and non-food items, thus implicitly assuming the income generated by a household is spent on this general basket of goods.

The EICV3 results shows that at the national level agriculture contributes the largest share of a household's income (46%), followed by wage income (25%), business income (i.e. self-employment), transfers, and rents.

Figure 5.6 below presents the household income shares in Rutsiro district. It shows that household income is driven by agriculture (49.4%), followed by wage income (23.2%) and business income (12.7%). The smallest contributor to household income in Rutsiro district is public transfer with 1.4%.

Figure 5.6 Household income shares in Rutsiro

Source: EICV3.

6 Agriculture

This section seeks to inform and support the development of the EDPRS2 with data from the EICV3 and focuses on the agriculture sector. It provides detailed insights into the living conditions of the Rwandan population with regard to agricultural production. Agriculture is the backbone of Rwanda's economy and the majority of households in Rwanda are currently engaged in some sort of crop or livestock production activity.

In recent years, the Government of Rwanda has implemented several ambitious programmes to increase the productivity of the agriculture sector. The motivation behind these actions is reflected in the Ministry of Agriculture's vision: 'Our Vision is to modernise Agriculture and Livestock to achieve food security. One of the key pillars of this vision is the transformation of Agriculture from subsistence to a productive high-value, market-oriented farming that is environmentally friendly and has an impact on other sectors of the economy.'

This section explores a wealth of evidence on agricultural production collected through the EICV3.⁷

6.1 Land

One of the major inputs in agricultural production is land. Rwanda is a small country with total arable land of about 1.4 million hectares.⁸

Given a growing population combined with strong reliance on agriculture, it is clear that land is one of the scarcest resources in Rwanda. The EICV collects detailed data on land use and the agricultural activities of Rwandan households. It is however important to note that the EICV is not a specialised agricultural survey.

Since the EICV does not require that the plot sizes of a household are measured, it is possible that estimates of land size are not as reliable as those that would be obtained by a specialist agricultural survey, nor are issues of land quality addressed.⁹ Here we classify households which cultivate land into the following categories; very small cultivators (under 0.3 ha), small cultivators (0.3 to 0.9 ha), medium cultivators (0.9 to 3 ha) and large cultivators (more than 3 ha).

7 Sample size of EICV3: 14,308 households. District-level estimates for selected indicators can be found in Annex A.

8 Rwanda State of Environment and Outlook, REMA/UNEP, 2009.

9 The CFSVA 2009 survey estimates that nationally, 19% cultivated under 0.1 ha, 37% under 0.2 ha, and 59% under 0.5 ha. EICV3 estimates that 16% cultivated under 0.1 ha, 32% under 0.2 ha, and 66% under 0.5 ha.

Figure 6.1 shows the mean size of land cultivated per household (in ha), by district. The mean size of land cultivated per household in Rutsiro district is 0.57 ha, which is slightly below the national average (0.59 ha). Most households (84.4%) in this district cultivate under 0.9 ha of land.¹⁰

Figure 6.1 Map: Mean size of land cultivated per household (ha), by district

10 The Food and Agriculture Organisation estimates that on average a Rwandan household requires at least 0.9ha to conduct sustainable agriculture (National Land Policy Report).

Figure 6.2 below presents the proportion of cultivating households with under 0.3 ha land, by district; it shows that they represent 52% in Rutsiro district. This is higher than the national average of 46%.

Figure 6.2 Percentage of cultivating households with under 0.3 ha land, by district

Source: EICV3. Note: Based on all households cultivating land for crop production. Horizontal line represents national average.

The map presented in Figure 6.3 below shows the proportion of households that have been exposed to the Land Tenure Regularisation (LTR) programme by district. It shows that 51% of households in Rutsiro district have been exposed to the LTR programme, ranking the district second on this indicator among all Western Province districts after Rubavu. It is also below the national average of 54.1%.

Figure 6.3 **Map: Percentage of households that have been exposed to LTR programme, by district**

6.2 Farming practices

Figure 6.4 presents the percentage of cultivated land which has been protected against soil erosion by district.

The percentage of land that has been reported as protected against soil erosion in Rutsiro district is 90%. Rubavu is reported to have the lowest percentage (47.9%) and Nyabihu the highest (94.1%) among all districts of Rwanda.

Around 78% of cultivated land nationally is reported as being protected against erosion, with Kigali City having the lowest percentage and Southern Province the highest.

Figure 6.4 Map: Percentage of land protected against soil erosion, by district

Figure 6.5 presents the percentage of agricultural households incurring expenditure on chemical fertiliser by district, which in Rutsiro district is about only 27.5%.

Nyabihu is the leading district on Western Province on this indicator (61.6%). The national average is around 29% with Gakenke district having the highest percentage (63%) and Nyarugenge district the lowest (2.2%) of all districts country-wide.

Figure 6.5 Percentage of agricultural households incurring expenditure on chemical fertiliser, by district

Source: EICV3. Note: Based on all households cultivating land for crop production. Horizontal line represents national average.

6.3 Commercialisation of crop production

Figure 6.6 below presents the mean share of harvest sold, by district. Commercialisation of crop production overall, as measured by the share of harvest sold (including *households selling zero crops*), is 18.3% in Rutsiro district.

This indicator is 20.9% at national level and about 20% in all other provinces outside Kigali City. It is the highest in Nyabihu district (28%) and lowest in Nyarugenge district (11%).

Figure 6.6 Mean share of harvest sold, by district

Source: EICV3. Note: Based on all households cultivating land for crop production. Horizontal line represents national average.

6.4 Livestock

In addition to crops, livestock is another important source of income and food for agricultural households.

Figure 6.7 presents the percentage of households raising livestock over the last 12 months by district. It shows that 76.4% of all households in Rutsiro district raise some type of livestock.

Over the last 12 months before the survey data collection, Rutsiro was ranked third within Western Province districts by percentage of households raising livestock, after Karongi (80.9%) and Ngororero (83%) districts.

This percentage is 68.2% at national level, 72.8% in rural areas, 41.8% in urban areas and between 69% and 76% in other provinces, excluding Kigali City where it is 34.5%.

Figure 6.7 Percentage of households raising livestock over the last 12 months, by district

Source: EICV3. Note: Horizontal line represents national average.

7 Education

Rwanda Vision 2020 acknowledges Rwanda as ‘suffering from serious deficiencies in terms of trained human capital’ and states as its major objective, the creation of ‘a knowledge-based and technology-led economy’ for which ‘comprehensive human resources development is considered to be one of the necessary pillars [for Rwanda] to reach the status of a middle income country (US\$ 220 GDP/capita in 2003 to US\$ 900 GDP/capita by 2020)’.¹¹

Although education is this section’s general theme, it focuses essentially on access to education rather than other areas of interest such as pupil/student performance and the quality of services delivered by the education system in Rwanda. This is because the EICV3 did not collect the data necessary for a comprehensive review of these areas of interest.

7.1 Schooling and literacy

Figure 7.1 below presents the percentage distribution of individuals aged six and above that have ever attended school by district.

It shows that 80% of individuals aged six and above in Rutsiro district have at some time attended school; this figure is slightly below the national average. Among all districts, the literacy rate is highest in Kicukiro district (94.4%).

Figure 7.1 Percentage of individuals aged six and above that have ever attended school, by district

Source: EICV3. Note: Based on all persons aged six and above. Horizontal line represents national average.

Figure 7.2 shows that literacy rate in Rutsiro district is 64.2% among the population aged 15 and above and is above the national literacy rate of 70%. The worst-performing district is Gisagara with 56.5%, while the best-performing is Kicukiro with 89.5%.

The literacy rate is 82.6% in urban areas and 67.3% in rural areas. The average level of literacy rate by province ranges from 67.5% in Southern Province to 68.7% in Northern Province, excluding Kigali City where it is 86.7%.

Figure 7.2 Literacy rate (%) among population aged 15 and above, by district

Source: EICV3. Note: Based on all persons aged 15 and above. Horizontal line represents national average.

7.2 Primary and secondary education

In Rwanda, the education and training system is structured into four main levels. A pre-primary level, which lasts three years, precedes the primary level that lasts six years. Above primary school, two levels exist, the first being a technical or vocational education, which aims at preparing students to enter the labour market once they complete this level, and the second being a secondary education, aimed at those students that wish to pursue a college or university degree before entering the labour market. Each of these levels is a six-year long programme. A fourth level is available for those completing secondary education or, in some cases, such as technical courses like those in the area of engineering, the technical or vocational levels. This education level is referred to as higher learning and comprises colleges and universities, lasting a maximum of seven years. The Nine-Year Basic Education Policy aims at ensuring that all children are 'able to get education in nine years (six years of primary education and three years of general cycle of secondary education) without paying school fees'.¹²

The map presented in Figure 7.3 below presents the net attendance rates (NARs) in primary school, by district. The NAR in primary school in Rutsiro district is 89%, which is below the national average of 91.7%, and the averages for urban (93.3%) and rural (91.5%) areas.

Figure 7.3 Map: NARs in primary school, by district

12 Nine-Year Basic Education Implementation – Fast Track Strategies, p3, MINEDUC, November 2008.

The map presented in Figure 7.4 below presents the NAR in secondary school by district. The NAR in secondary school in Rutsiro is 12%. This is below the national average of 21% and the averages for rural and urban areas, which are 18% and 37% respectively.

The three districts with the highest NARs in secondary school are Kicukiro, Gasabo and Nyarugenge of Kigali City.

Figure 7.4 Map: NARs in secondary school, by district

The EICV3 survey asked users of all levels of the education system questions about their satisfaction with the education services received. Although on a self-perceived basis, these questions allow for a review of the progress observed in the level of satisfaction of users.

Figure 7.5 below presents these results by district. Across all Rutsiro district, 65.4% of the users of education services in 2010–11 were satisfied with these services. This is below the national level of users’ satisfaction (82%).

Of all districts, Rutsiro is ranked second last by level of user’s satisfaction with education services, after Nyamasheke (64%).

The results show that satisfaction is lower among users in rural areas (81%) than in urban areas (87%).

Figure 7.5 Percentage of users satisfied with education services, by district

Source: EICV3. Note: Based on all persons currently attending education. Horizontal line represents national average.

7.3 ICT education

Figure 7.6 presents results of a broader approach, investigating computer literacy in the overall population aged six and above that have used a computer before and would feel confident about using one again, by district.

The survey results show that only 0.7% of the population aged six and above in Rutsiro district have used a computer before and would feel confident using one again. This is below the rural area average, ranking the district last country-wide.

Among the urban population, 14% are classified as computer literate, but this applies to only 2% of the rural population. Only 4% at national level can be classified as computer literate.

Figure 7.6 **Computer literacy: Percentage of population aged six and above that have used a computer before and would feel confident about using one again, by district**

Source: EICV3. Note: Horizontal line represents national average.

8 Vulnerable groups

Groups that are considered particularly vulnerable by the Government of Rwanda are children under five years old, elderly people aged 60 and over, and people with disabilities. The government delivers a core set of social protection programmes through the Ministry of Local Government (MINALOC), supported by a number of complementary initiatives delivered by other ministries.

The main programme run by MINALOC, and a flagship of the EDPRS 2008–2012, is the Vision 2020 *Umurenge* Programme (VUP) which contains three pillars: VUP public works, VUP direct support, and VUP financial services. The three pillars represent public works for the poor who are able to work, cash transfers for very poor households without labour capacity, and financial services such as the *Ubudehe* Credit Scheme.

In addition to the VUP, MINALOC runs two other social assistance schemes: the Genocide Survivors Support and Assistance Fund, and the Rwanda Demobilisation and Reintegration Commission. Outside these core programmes are the social protection initiatives run by other ministries such as the Girinka ‘One Cow per Poor Family’ programme of the Ministry of Agriculture, the free basic education programme, subsidised subscriptions for mutual health insurance, and in-kind social care services run by the Ministry of Gender and Family Promotion. Moreover, Rwanda has a limited system of contributory social protection mechanisms that enable people in formal employment to access medical care and an old-age pension.

8.1 People with disabilities

The following Figure 8.1 presents the percentage distribution of persons with a major disability, by district. It shows that Rutsiro district has 7.6% of people with a major disability. This percentage is above the national average of 4.5%, ranking the district third country-wide, after Karongi (7.8%) and Burera (8.2%).

Figure 8.1 Percentage of persons with major disability, by district

Source: EICV3. Note: Horizontal line represents national average.

8.2 Orphans

Figure 8.2 below presents the percentage distribution of orphans – including those with *one parent or both parents* deceased – among the population aged 0–20, by district. It shows that Rutsiro district has 2.7% of orphans with both parents deceased and 13% of orphans with one parent deceased. The first estimate is similar to the national average while the second is slightly below the national average (14%).

Figure 8.2 Percentage of orphans (one parent or both parents) among population aged 0–20, by district

Source: EICV3. Note: Based on all persons aged 0–20. Districts ordered by percentage of orphans (one or both parents). Horizontal line represents national average of orphans (one or both parents).

9 Some gender aspects

The resident population of Rutsiro district is 326,000. Males comprise 155,000 and females 171,000, meaning females outnumber males by 16,000.

Figure 9.1 below presents the percentage of heads of household by gender in Rutsiro district. It shows that 28% of households in Rutsiro district are headed by females and 5% are '*de facto female-headed households*', i.e. those headed by females in the absence of a male head who is ordinarily present.

Figure 9.1 Sex of heads of household in Rutsiro

Source: EICV3. Note: In addition to the households who reported the household head as female, other households were headed by females in the absence of a male head. We call these households '*de facto female-headed households*'. These households were temporarily headed by females whose husbands had been away for long periods of time.

Figure 9.2 shows the percentage distribution of employment by gender in Rutsiro district. It shows that the majority of females in Rutsiro district are small-scale farmers (74.5%); 14.1% are wage farm workers, 4.9% are wage non-farm workers and 4.5% are independent non-farm workers. Males are more involved in small-scale farmer work (47.5%); 23% are wage non-farm workers, 14.2% wage farm workers and 12.6% independent non-farm workers.

Figure 9.2 Employment type by sex in Rutsiro

Source: EICV3. Note: Based on all working people aged 16 and above.

10 Conclusions for Rutsiro

The estimated total population of Rutsiro district as provided by the EICV3 survey in 2010–2011 is 326,000. This represents 13.7% of the total population of Western Province and 3% of the total population of Rwanda. Females comprise 52.4% of the population of Rutsiro district. The majority is young with more than a half (56%) aged 19 or younger and 84.7% of the population aged under 40.

According to the poverty indicators for Rutsiro district, 53% of the population is poor (including extreme-poor). This figure is higher than the Western Province average, which is 48.4% (including extreme poor). Rutsiro is ranked ninth among all districts country-wide with a high percentage of poor population. Only about 47% of the population in Rutsiro district is identified as non-poor, 27% as poor (excluding extreme-poor) and 26% as extreme-poor.

Regarding access to drinking water, Rutsiro district has not yet achieved the EDPRS national target for the water and sanitation sector, which is to increase access to drinking water to 85% by 2012. Currently, 60% of households in Rutsiro are using an improved drinking water source.

Rutsiro district has 63.4% of households with access to improved sanitation facilities, which is below the national average (74.4%), and has not yet achieved the EDPRS target on sanitation, which is to have nationally 65% of the total population with hygienic sanitation by 2012. Among the Western Province districts, Rutsiro is ranked last by percentages of households using improved sanitation.

Dwelling characteristics show that Rutsiro is ranked last of all districts country-wide by the percentage of households using cement floor (4%), but it has only 3.5% of households with mud-covered tree trunks as wall material and comes first among all districts in the country for eliminating this kind of non-durable wall material. In the district, only 0.4% of households use electricity as their main source of lighting, ranking it second from bottom among all districts of the country.

The mean walking distance to a primary school in Rutsiro district is 29 minutes and 37.8% of households are between 30 and 59 minutes of a primary school. This is above the mean walking distance to a primary school in rural areas (28.6 minutes) as well as the national average (27.2 minutes). The mean walking distance to a health centre in Rutsiro district is 69 minutes and only 35.4% of households walk for under an hour to reach a health centre. Therefore, health centres are further from household dwellings in Rutsiro than they are on average in all rural areas (the average figure is 64.4 minutes).

In Rutsiro district, the overall employment rate is 86% of the resident population aged 16 years and above, and the economic inactivity rate is 14%. The Rutsiro district employment rate is above the national average. Among Western Province districts, Rutsiro is ranked second by employment rate, after Ngororero district (92.7%). Country-wide, Rutsiro is ranked first by the time spent by persons aged 16 and above on domestic duties.

The household income is driven by agriculture (49.4%), followed by wage income (23.2%) and business income (12.7%). The smallest contributor to household income in Rutsiro district is public transfer income (1.4%).

The mean size of land cultivated per household in Rutsiro district is 0.57 ha, which is slightly lower than the national average (0.59 ha). Half of cultivating households cultivate under 0.3 ha land, which is higher than the national average. The percentage of land that has been reported as protected against soil erosion in Rutsiro district is 90% and 76.4% of all households in Rutsiro district raise some type of livestock.

Regarding education indicators, 80% of individuals aged six and above in Rutsiro district have at some time attended school; this figure is slightly below the national average. The literacy rate in Rutsiro district is 64.2% among the population aged 15 and above; this is above the national literacy rate of 70%. The NAR in primary school in Rutsiro district is 89%, which is below the national average of 91.7%, and the averages for urban (93.3%) and rural (91.5%) areas. The NAR in secondary school in Rutsiro is 12%. This is below the national

average of 21% and the figures for rural and urban areas, which are 18% and 37% respectively.

Of all districts, Rutsiro is ranked second last by level of users' satisfaction with education services. Moreover, the survey results show that only 0.7% of the population aged six and above in Rutsiro district is considered computer literate. This is below the rural area average, ranking the district last country-wide on this indicator.

Indicators of vulnerability show that Rutsiro district has 7.6% of people with a major disability, which is above the national average of 4.5%, ranking the district third country-wide. Orphans with both parents deceased represent 2.7% of the population aged 0–20 and orphans with one parent deceased 13%.

Some gender aspects were also analysed and revealed that 28% of households in Rutsiro district are headed by females and 5% are *'de facto female-headed households'*. The distribution of employment by gender shows that in Rutsiro district the majority of females are small-scale farmers (74.5%); 14.1% are wage farm workers, 4.9% are wage non-farm workers and 4.5% are independent non-farm workers. Males are also involved in small-scale farmer work (47.5%); 23% are wage non-farm workers, 14.2% wage farm workers and 12.6% independent non-farm workers.
