Foreword

The Government of Rwanda needs updated information for monitoring progress on poverty reduction programmes and policies as stipulated in the second Economic Development and Poverty Reduction Strategy (EDPRS2), the Millennium Development Goals (MDGs) and Vision 2020.

The 2013/14 EICV is a follow-up to the 2000/01, 2005/06 and 2010/11 EICV surveys. Each survey provides information on monetary poverty measured in consumption expenditure terms, but also provides complementary socio-economic information that facilitates understanding changes in households living conditions.

The 2013/14 EICV was implemented by the National Institute of Statistics of Rwanda (NISR), in collaboration with different stakeholders in the country.

Results of the 2013/14 EICV indicate substantial progress in poverty reduction and improvement in other socio-economic and demographic indicators in the last three years. The survey shows that poverty is at 39.1% as of 2013/14, down from 44.9% as was reported in 2010/11. During the same period, extreme poverty dropped from 24.1% to 16.3%.

Generally the progress is impressive. However challenges remain; many Rwandans are still poor and for many others living conditions still need to be improved especially in areas of education and employment.

I find these findings very informative; the report is an important vehicle for addressing poverty concerns and informing policy makers and other stakeholders where to intervene. We should stay on course.

I urge all stakeholders: government, researchers, partners and the general public to optimize the use of these findings.

Finally, I congratulate the National Institute of Statistics of Rwanda and all those who contributed in one way or another in this exercise, for the job well done.

Claver Gatete
Minister of Finance and Economic Planning

Acknowledgements

While celebrating a decade since its establishment, the National Institute of Statistics of Rwanda (NISR) is honoured to present the results of EICV4 conducted in 2013/14.

Through the second National Strategy for the Development of Statistics (NSDS2), NISR has managed to increase the frequency of some surveys to provide timely and update statistics that will facilitate monitoring and evaluation of different policies and programmes at both national and international levels.

The frequency of EICV is now three years. This is an ambitious target that we are committed to achieve in collaboration with our stakeholders in order to support evidence-based decision and planning processes with more frequent and reliable statistics.

In this regard, we present our sincere appreciation to the Government of Rwanda for its support for statistics development in the country, the Ministry of Finance and Economic Planning, and other Government Ministries and Agencies for the facilitation that we received in this endeavour and in other similar efforts.

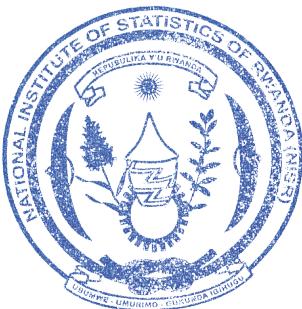

We express our gratitude to Development Partners that support statistics development in the country and especially EICV4; including: The African Development Bank (AfDB), World Bank, UK Aid, European Union, One UN and other UN agencies in the country. Their contribution was of immense importance to the effective accomplishments of the survey.

We also express our profound gratitude to the advisory team of national and international experts for their advice while constructing the survey, constructing the food basket and setting a new poverty line. Their technical advice contributed to the success of the analysis.

We would also like to thank the EICV management team for their effort throughout the planning and implementation stages of 2013/14 EICV; and also appreciate the valuable support provided by administrative and financial departments of the NISR. Their contribution allowed this exercise to be carried out smoothly.

Yusuf Murangwa
Director General, NISR

Important technical notes for data users

Revision of urban and rural classification in the EICV3 and EICV4 data

While preparing the 2012 Rwanda Population and Housing Census (RPHC), the urban and rural classification of all villages was revised, hence the 2012 RPHC embraced four classifications: (1) urban, (2) rural, (3) peri-urban, and (4) semi-urban. Depending on the characteristics of a given area, the NISR defines the urban domain as the combination of urban and semi-urban, whereas the rural domain is composed of rural and peri-urban. The EICV4 sample was designed and drawn using the sampling frame of enumeration areas from the 2012 Rwanda Population and Housing Census, and the corresponding new urban and rural classification was taken into consideration.

In order to ensure consistency with the Urban and Rural classification for EICV2 sample, which was built on the sampling frame from the 2002 Census, the EICV3 analysis was carried out based on the urban and rural classification from the 2002 Rwanda Population and Housing Census. Given the fact that prior to EICV3, Rwanda was divided into new administrative entities, the old administrative structure which was used in the 2002 Population and Housings Census had to be updated using GIS databases so as to appropriately classify the EICV3 sample villages by the Urban-rural 2002 code.

To allow a comparison between EICV4 and EICV3 estimates with respect to residence areas, it was essential to apply the same urban/rural classification to data from both survey rounds. This means using the new classification established in 2012 in both surveys (EICV3 and EICV4) for all tabulations by urban-rural location of the unit of analysis. This was done to make sure the current distribution of the population and population characteristics are correctly represented. Therefore, the EICV3 estimates disaggregated by urban/rural presented in this report reflect the new classification established in 2012.

However, it is noteworthy to mention that slight differences might be observed when comparing the distribution of households in EICV3 under the 2002 and 2012 Population and Housings Census classifications. This implies that due to some villages having changed their urban/rural status, the EICV3 data presented in this report might narrowly differ from estimates presented in previous EICV3 reports.. The following table shows a cross-tabulation of the two urban-rural classification variables for the EICV3 sample of households.

Table 0.1: Classification of sample households (unweighted) in the EICV3 survey by 2002 and 2012 urban-rural classifications

	Urban (2002)	Rural (2002)	Total (2012)
Urban (2012)	1,357	705	2,062
Rural (2012)	792	11,454	12,246
Total (2002)	2,149	12,159	14,308

Source: EICV3; urban-rural classification from RPHC 2012.

Rounding of estimates

Estimates presented in the tables are expressed with one decimal place. However, to improve readability, estimates referred to in the interpretation of results have been rounded to the nearest integer, except for the discussion of relatively small percentages.

Consumption quintiles

Throughout the report results are also disaggregated by consumption quintiles. Quintiles are constructed by sorting the sample of households by annual consumption values, and dividing the population into five equal groups. The 20% of individuals with the highest annual consumption are allocated to quintile 5, and the 20% of individuals with the lowest levels of annual consumption are allocated to quintile 1. The poorest households and their members are found in quintile 1 and the richest are found in quintile 5.¹

EICV uses consumption as a proxy for income, as is common when estimating poverty. Quintiles are a relative measure of individuals' consumption in comparison to the rest of the population during a specific period. Therefore, comparisons between EICV3 and EICV4 do not inform about and are not comparable in terms of consumption levels as thresholds set to allocate population to the quintiles are not the same in both survey rounds.

¹ The shares in the tables at the individual level are slightly different from 20% in each quintile as domestic servants are excluded in the consumption aggregate estimation and hence the definition of thresholds for quintiles, but are included in most of the thematic analysis in this report. Moreover, tables at household level tend to show fewer households in the bottom quintiles and more households in the top quintiles, since quintiles are established at person-level and households in higher quintiles tend to have fewer household members.

Executive summary

Background to the EICV4 and the EICV series

This report presents and discusses detailed results from the EICV4 and compares them with EICV3 in the areas of water and sanitation, energy, housing, transport and ICT facilities.

The EICV4 survey, conducted over a period of 12 months between October 2013 and October 2014, is the most complex survey since the series started. The survey had three components. In addition to the cross-sectional sample, analysed in this report, the EICV4 included a panel survey methodology for the first time, using a subsample of EICV3 households. At the same time as the EICV4 cross-sectional and panel surveys, the NISR conducted an independent Survey of individuals and households sampled from the VUP (Vision 2020 Umurenge Programme) list of beneficiaries using the same EICV4 questionnaire and field methodology. The VUP sample has been analysed in the report on Social Protection.

For the cross-sectional analysis, a new sample of 12,312 households was drawn using the 2012 Rwanda Population and Housing Census as sampling frame for enumeration areas as primary sampling units. Households and household members interviewed as part of the panel survey that remained in the same village as in EICV3 are also included in the cross-sectional sample, bringing the total number of households analysed to 14,419.

The EICV4 took place three years after the EICV3 was conducted (October 2010 to October 2011) and aims to provide even more timely evidence to support policy-making and continuous evaluation of the EDPRS2; prior to that the EICV was conducted every 5 years with the first survey (EICV1) conducted in 2000/01. A strong feature of the EICV series is that its methodology has remained relatively unchanged since 2000/01. This allows calculating indicators in a consistent way for more than one survey round in order to investigate trends and to inform the planning framework of the Economic Development and Poverty Reduction Strategy (EDPRS) as well as other target indicators, such as the Millennium Development Goals, and upcoming Sustainable Development Goals.

In this report, the majority of tables provide results both for EICV3 and EICV4 and highlight developments over time, as well as discussing different patterns across the provinces in Rwanda and in urban and rural areas. Emphasis has been placed on including disaggregated results for men and women and male- and female-headed households to explore gender-related aspects in key social and economic characteristics of persons and households in Rwanda, and other disaggregation, such as age group, type of habitat, etc where necessary. Districts tables have been also provided in annex.

Water and sanitation

EICV4 shows the progress observed in the use of improved drinking water source (85% compared to 74% in EICV3) over the period of three years at national level. Usage rates are higher in Urban areas (90%) compared to rural areas (84%). At national level, 25% of households are within 0–4 minutes walking distance of an improved drinking water source

while 58% of households are within 0–14 minutes walking distance one-way). The proportion of households having access to improved sanitation increased from 75% in 2010-11 to 83% in 2013-14. Considerable improvement is notable across quintiles as well.

Energy

The survey provides also information on the main source of energy for cooking and lighting. In urban areas, the majority (67%) of households use charcoal as cooking fuel. In rural areas, firewood remains the most used type of cooking fuels, (94%). The use of charcoal has increased across all five provinces since the EICV3. Use of electricity for lighting has approximately doubled at national level since 2010-11 from 11% to 20% in 2013-14. The highest proportion of households using electricity for home lighting is found in Kigali city (73%). In other provinces the proportion of households using electricity for home lighting ranges between 9% and 15%.

Housing

The EICV4 results show an increase by eleven percentage points of households living in Imidugudu from 38% in 2010-11 to 49% in 2013-14. Single house dwelling has decreased from 92% in 2010-11 to 90% in 2013-14). This type of dwelling is more common in rural (94%) areas than in urban areas (72%) and especially in the Northern Province (99%) in 2013-14.

EICV also provides information on construction materials used for roofs, walls and floors in Rwanda. The use of metal sheets as roofing material has become more common across the country, with a rate of 61% at national level in 2013-14 compared to 54% in 2010-11. This increase is significant even in lowest quintile from 40% in 2010-11 to 56% in 2013-14.

The majority of households country wide use mud bricks as wall construction materials (36%), while those using tree trunks with mud has decreased in rural areas from 40% in 2010-11 to 33% in 2013-14. The proportion of households that use mud bricks covered with cement has increased notably from 19% in 2010-11 to 24% in 2013-14 at national level. Beaten earth is the most commonly used flooring material in Rwandan dwellings. However, it has decreased from 78% in EICV3 to 74% in EICV4. The proportion of dwellings with cement as flooring material has increased from 17% in 2010-11 to 21% in 2013-14. In urban areas 63% of households have cement as flooring material compared to only 12% of households in rural areas.

Furthermore, the survey presents data on households with rain water management system. Results show that 17% of households in Rwanda have a way of managing rain water. Compost heap and thrown in bushes/fields remain the method that households widely use for rubbish disposal (52% and 40% respectively in EICV4).

Regarding access to basic services and infrastructures, the data show that the mean walking time to services such as markets, health centres, primary and secondary schools in rural areas has reduced. For example, households who walk 1-2 hours to a health centre reduced from 41% in 2010-11 to 37% in 2013; while those who walk 0-30 minutes to a health centre increased from 13.5% in 2010-11 to 18% in 2013-14.

Transport

The survey provides information on the distance to transport infrastructure, usage and perception of change in quality in the last 12 months. It also provides information on household ownership of transportation assets such as vehicles, bicycles and motor cycles.

The proportion of households accessing all-weather roads regularly or often has increased by three percentage points from 93% in 2010-11 to 96% in 2013-14 at national level. The majority of rural households in Rwanda walk to an all-weather road in less than 20 minutes. At national level, 77% of households are satisfied with their nearest all-weather road, which shows an increase of user satisfaction level of twelve percentage points compared to 65% in EICV3. On the perceptions of changes in quality of all-weather road, 35% of respondent households think it has improved and 59% feel that the quality of all-weather roads has remained the same.

The usage rate of public transport stages, in 2013-14 stands at 82% in urban areas compared to 43.5% in rural areas. 18% and 65% of rural and urban households respectively walk less than 20 minutes to a public transport stage.

Majority of private vehicle (not for commercial) owners fall within the richest quintile in both surveys. In urban areas, 2% of households own a motorcycle and 4.5% own a car in 2013-14. Ownership of bicycle is much higher in rural areas (17%) than in urban areas (10%) in EICV4.

ICT

This report provides data on access to ICT devices and services (like mobile phones, computer, etc) among households. Household ownership of ICT devices has increased significantly between EICV3 and EICV4. 64% of households own at least one mobile phone, 60% own a radio, 10% own a TV set and 2.5% own a computer in 2013-14. Access to internet has also increased from 4% of households in 2010-11 to around 9% in 2013-14. 33.5% households in urban areas have internet access compared to 4% in rural areas. Most internet access is via mobile phones (81%). At national level, 7% of the population feels confident about using a computer. In urban areas 23% of the population feels confident about using a computer, compared to 4% in rural areas in 2013/14. Households not owning an ICT device may still use public ICT services such as public internet service facilities and public phones. Only 2% of households use public internet facilities in Rwanda (regularly and often). The highest usage rate is found in Kigali (7%) compared to other provinces. The user satisfaction level is very high across the country among the households using public internet services. 92% of households are satisfied with their nearest internet services in 2013-14.

Chapter 1: Introduction

The second Economic Development and Poverty Reduction Strategy (EDPRS2: 2013-2018) mainstreams a system of monitoring and evaluation at national, sub-national and sectoral levels of the government's socio-economic performance vis-a-vis the country's long term development aspirations as embodied in Rwanda Vision 2020.

A key input into the mid-term evaluation of the EDPRS2 is the evidence collected through the EICV4 survey. Fieldwork for the survey was conducted by the NISR between October 2013 and October 2014. Three reports based on EICV4 data were released by the NISR in September 2015: The Main indicators report, Rwanda poverty profile report, and social protection and VUP report. Following from these initial publications, the NISR releases a series of seven (7) further reports that explore in depth seven (7) different topics that are of high importance to the mid-term evaluation of EDPRS2.

This report is one of the seven (7) aforementioned thematic reports. It focuses on water, sanitation, energy, transport and ICT facilities sectors. During the development of water, sanitation, energy, transport and ICT sector strategic plans for EDPRS2, key utilities and amenities related indicators were integrated in the EICV4.

This report explores a wealth of evidence collected through the EICV4. It also makes use of the fact that the sample sizes of third and fourth rounds of are sufficient to provide estimates that are reliable at the district.

Following some short methodological notes in the following section, chapter 2 and 3 of this report discuss access to water, sanitation and main source of energy for households lighting and cooking across the population of Rwanda. Chapter 4 describes the housing characteristics in Rwanda. Chapter 5 provides information on transport infrastructure. Finally, chapter 6 presents data on access to ICT devices and services among households. The annexes provide district-level estimates for selected key indicators as well as confidence intervals.

Chapter 2: Water and sanitation

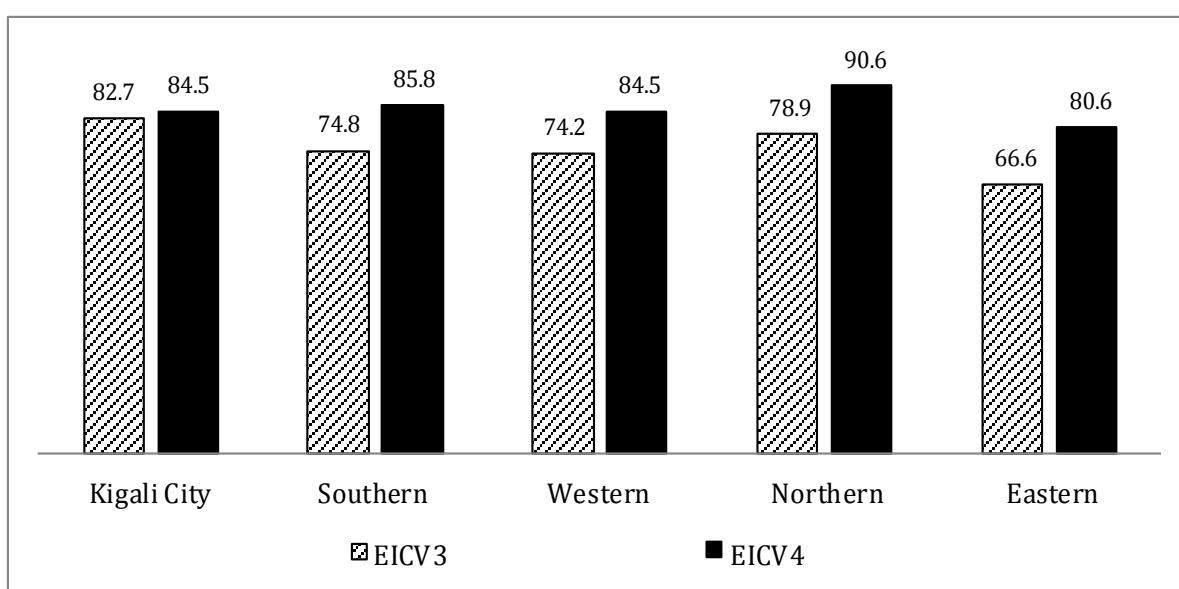

This chapter provides information on access to water and sanitation across the population of Rwanda using data from both surveys (EICV3 and EICV4). Concerning access to water the main focus is on access to improved drinking water, distance to improved water source and user satisfaction with improved water source. The estimates presented in this section measures also the progress or changes between 2010-11 and 2013-14.

2.1. Drinking water

Table 2.1 and Figure 2.1 show the percentage of households whose main source of water is an improved source. The international definition of an improved water source includes: protected springs, public standpipes, water piped into dwelling/yard, boreholes, protected wells and rain water collection. Here the increase between 2010-11 and 2013-14 was by 12 percentage points to 84% compared to an increase by 3 percentage points to 90% in Urban during the same period.

At province level the Northern Province ranks first with the highest percentage of household (91%) using improved water sources. The majority of households in this province rely on protected springs (50%) and public stand pipes (36%) for their water. By contrast the Eastern province ranks fifth with the least percentage (81%) using improved water sources. It is worth noting that the Eastern province had the largest increase in use of improved water sources by 14% points to 81% between 2010-11 and 2013-14 compared to all other provinces.

Figure 2. 1: Change in households with improved drinking water source (Percentage)

Source: EICV4 and EICV3. Base population: all households.

A similar trend can be observed at quintile level whereby the percentage of households using improved water sources increased by at least 11 percentage points in the bottom four quintiles compared to 5 percentage point increase in the highest quintile.

The data also reveal that the use of improved water source may be related to type of habitat since, households living in Imidugudu increased between 2010-11 and 2013-14 by 12 percentage points. By contrast households living in other types of habitat such as isolated rural housing have the least percentage (81%) using improved water sources.

Table 2.3 shows the mean distance to the nearest main improved water source. At national level, 24% of households are within 0–200 meters of an improved water source compared to 25% in EICV3. This includes households with water piped into the yard/dwelling and those who access improved water sources within 200m.

Source: EICV3. Base population: all households. Note: (1) EICV3 estimates differ slightly from those reported in the EICV3 Thematic Report due to a new urban /rural classification used in EICV4.

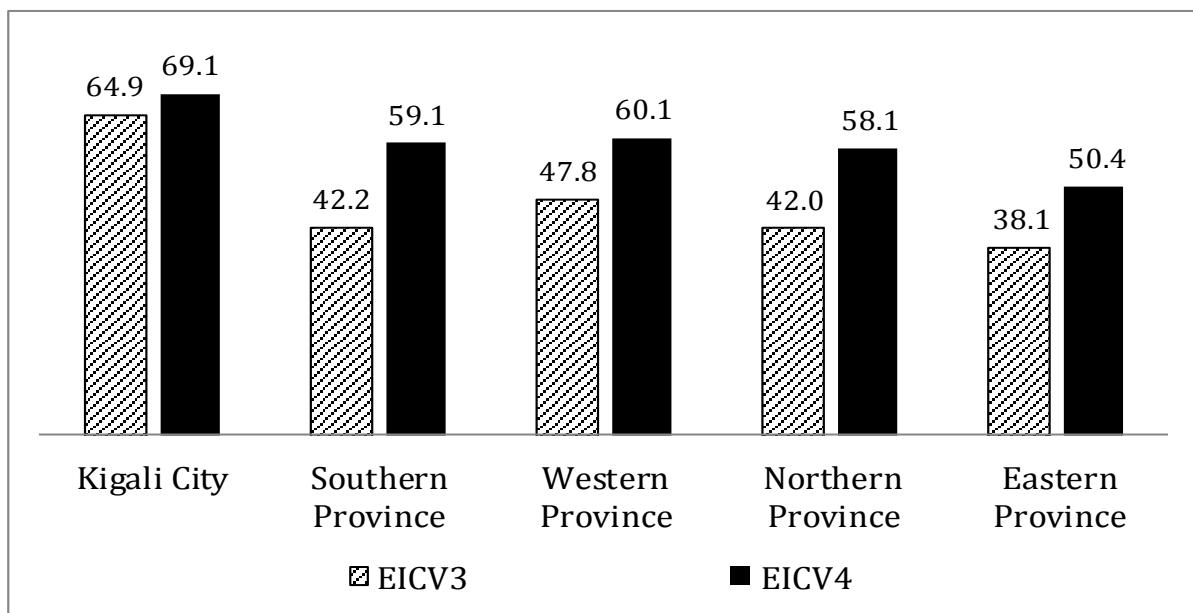

It emerges from the data that in urban areas, 67% of households access improved water source within 200m in 2013-14, compared to 53% in 2010-11; whereas in rural areas, 57% of household access improved water source within 500 m compared to 41% in 2010-11 as shown in Figure2.2.

Figure 2. 2: Percentage of HHs using an improved water source that is within 200m in Urban and 500m in Rural

Source: EICV3 and EICV4

Another important finding to note is that at national level 58% of households walk for less than 15 minutes to access improved drinking water sources in 2013-14 compared to 45% in 2010-11. The distribution at provincial level is shown in Figure 2.3.

Figure 2. 3: Percentage of HHs that walk less than 15 minutes to an improved water source

The findings detailed in Table 2.5 highlight the main reasons of not using the nearest drinking water sources. The prominent reason relate to non functioning water sources (38%) followed by expensive water (16%). Across provinces, the Eastern province has the highest level of non functioning drinking water sources (60%), while water is viewed as expensive in the Northern Province (29%).

Table 2. 5: Percentage of HHs not using the nearest drinking water source and main reason, by province, urban/rural, quintile, habitat and Sex of head of HH

EICV4	% not using drinking water declared as nearest source	Reasons for not using drinking water declared as nearest source						Total	Total no. of HHs not using the nearest drinking water source (in 000s)
		Too expensive	Not safe	Difficult terrain	Too far	Does not function	Other

Concerning the satisfaction with the service on drinking water sources, the data reveal an overall increase in user satisfaction level from 54% to 55%; but a significant decrease is observed in Kigali city and urban areas as shown in Table2.6.

2.2. Sanitation

Over all data show an increased access to improved sanitation. Based on Table 2.7, it is clear that the proportion of households with access to improved sanitation increased from 75% in 2010-11 to 83% in 2013-14. Notable improvement is also observed in the poorest quintiles.

Table 2. 7: Sanitation type used/access to improved sanitation, by province, urban/rural, quintile, habitat, and disability status

Chapter 3: Energy

This chapter provides information about the main source of energy for households lighting and cooking across the population of Rwanda using data from both surveys (EICV3 and EICV4). In addition, it highlights the progress made between 2010-11 and 2013-14.

3.1. Fuel use

Over the period of three years the findings in table 3.1 show that the households using electricity 2010-11 for home lighting have almost doubled at the national level(from 11% in 2010-11 to 20% in 2013-14). Access to electricity is predominantly very high in the households living in Kigali city where it has risen from 56% to 73 % between 2010-11 and 2013-14.

Source: EICV3. Base population: all households.

The proportion of households using batteries as their main source of home lighting has also increased where around half of the households use batteries (44%) in 2013-14. Another interesting finding to note is the significant decrease in the use of lantern as the

main source of home lighting from 35% in EICV3 to 13% in EICV4. Figure 3.1 shows that electricity use is high in the richest consumption quintile with 59% as compared to the lowest quintile with 3 % in 2013-14.

Figure 3. 1: Changes in household access to electricity (Percentage)

Source: EICV4 and EICV3. Base population: all households.

Table 3.2 provides information on primary fuel sources used for cooking. Use of firewood for cooking has declined slightly in the last 3 years. However at national level firewood remains the most widely used cooking fuel with 83% in EICV4 from 86% in EICV3, followed by charcoal (15% in EICV4 and 10% in EICV3). In urban areas, the majority of households use charcoal as a main source of cooking fuel (67%). In rural areas, firewood is the most commonly used cooking fuel by 94% of the households in 2013-14.

Chapter 4: Housing

This chapter focuses on the type of dwelling, housing characteristics, waste management facilities, household relocation, rent arrangements, dwelling and durables in Rwanda. The estimates presented in this chapter indicate the progress made between EICV3 and EICV4.

4.1. Dwelling characteristics

The data in this section show a substantial increase of households living in Imidugudu from 37.5% in 2010-11 to 49% in 2013-14 as detailed in Figure 4.1. It is also notable that households living in isolated rural housing reduced considerably.

Figure 4. 1: Change in specific habitat types

Source: EICV4 and EICV3. Base population: all households.

Table 4.1 shows that the Eastern province registers the highest percentage of population living in Imidugudu settlements (78%). However, the Southern Province has the highest rate of growth in Imidugudu settlements: over half of the households (50.5%) live in Umudugudu in 2013-14, compared to 18% in 2010-11.

According to Table 4.2, single house dwelling has decreased slightly since EICV3 (from 92% in 2010-11 to 90% in 2013-14) and this type of dwelling is more common in rural areas (94%) than urban areas (72%) in 2013-14. The Northern Province dominates other provinces in this type of dwelling (99%) in 2013-14.

Source: EICV3. Base population: all households.

Table 4.3 shows that the average number of people per bedroom is at least 2 both in urban and rural areas in 2013-14. For about 9% of households in Rwanda, on average four or more people sleep in the same bedroom. With reference to quintiles, the data show that the higher the quintile, the lower the number of people sharing the same bedroom (2 per bedroom in the highest and 3 per bedroom in the lowest).

Table 4. 3: Number of persons per bedroom, by province, urban/rural, quintile and habitat

Table 4.4 shows the mean floor area (in m²) of Rwandan households' dwellings. This is 39m² on average and Imidugudu are roughly in line with the national average. Although wealthier households and households in modern planned areas occupy larger spaces, the mean floor area has not changed significantly since 2010-11 at national level.

Table 4. 4: Floor area, by province, urban/rural, quintile and habitat

Source: EICV3. Base population: all households.

In 2013-14 the proportion of households using metal sheets has increased substantially: 61% against 54% in 2010-11. Figure 4.2 shows that households predominantly use metal sheets as roofing materials across Rwanda compared to other types. It is

important to note that the use of metal sheets as roofing materials has increased even for the bottom quintile (from 40% in 2010-11 to 56% in 2013-14).

Figure 4. 2: Changes in roofing material

Source: EICV4 and EICV3. Base population: all households.

Table 4.5 shows that in Kigali city and the Eastern province almost all households use metal sheets (99% to 96% respectively).

Source: EICV3. Base population: all households.

Table 4.6 presents data on material used for constructing walls. Over all, it emerges that the majority of households country wide use mud bricks (36%), while those using tree trunks with mud has decreased in rural areas from 40% in 2010-11 to 33% in 2013-14 as shown by Figure 4.3. Another important finding to note is that the types of wall material used vary across all provinces and the proportion of households that use mud

bricks covered with cement has increased from 19% in 2010-11 to 24% in 2013-14 at national level.

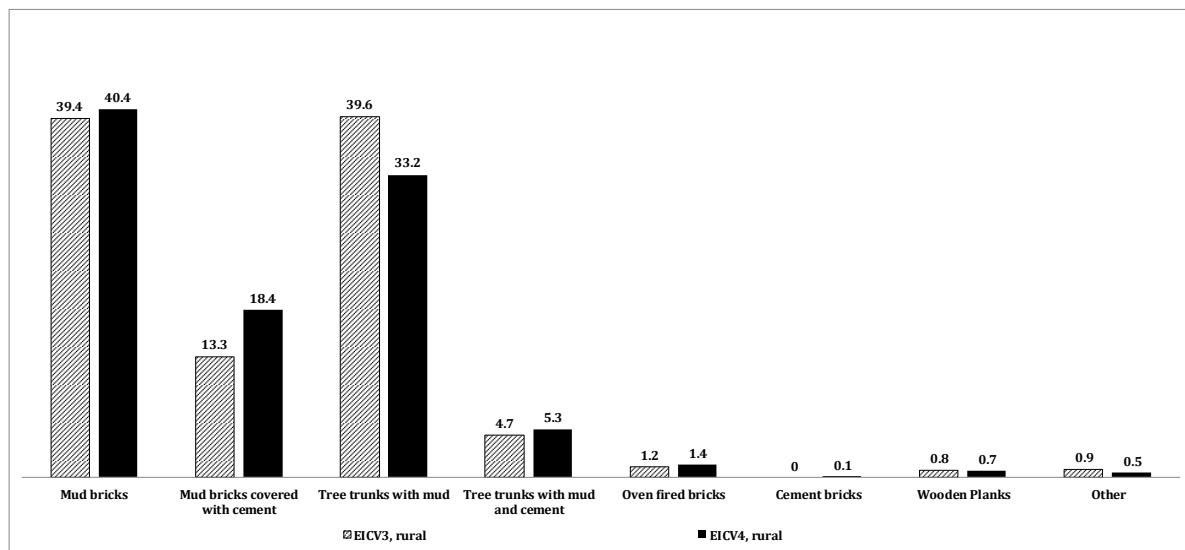

Table 4. 6: Wall material of the dwelling, by province, urban/rural, quintile and habitat

Figure 4. 3: Changes in wall material used in rural dwellings

Source: EICV4 and EICV3. Base population: all households.

With regard to flooring materials, Table 4.7 shows that beaten earth is the most commonly used in the dwellings in Rwanda (74%), followed by cement with 21% in 2013-14. In urban areas 63% of households have cement as flooring material compared to 12% of rural households. Nevertheless at national level, a close analysis of data reveals notable improvements, considering that 17% of rural households had cement floors in 2010-11. Figure 4.4 illustrates that the use of cement floors has slightly increased across all provinces, with some specific prominence in the Eastern province.

Figure 4. 4: Changes in Percentage of HHs with cement flooring

Source: EICV4 and EICV3. Base population: all households.

Table 4.8 shows the percentage of households with rain water management system. 17% of households in Rwanda have a way of managing rain water. Households in Rwanda use mostly ditch (13%) as a way of managing rainwater compared to other used types of rainwater management system. Only 2% of households use rain water tanks in 2013-14.

Table 4. 8: Percentage of HHs with rainwater catchment systems, by province, urban/rural, quintile and habitat

Table 4.9 highlights that compost heap and thrown in bushes/fields remain the most widely used method by households for rubbish disposal in Rwanda (52% and 40% respectively in EICV4). A close analysis reveals a slight increase in the use of rubbish collection services at national level from 5% in EICV3 to 6% in EICV4.

4.2. Distance to basic services

This section focuses on the mean walking time to key public amenities (Market, Primary, and secondary schools, health centres) Table 4.10 shows that the mean walking time to services in rural areas decreased between the two surveys.. For example while 41% of households walked 1-2 hours to a health centre in 2010-11, 37% spend the same time in 2013-14. Similarly the percentage of households walking 0-30 minutes to a health center increased from 13.5% to 18% between 2010-11 and 2013-14.

Table 4. 10: Walking distance to basic services (market/shop, public transport stage, primary schools, secondary schools, health centre)

4.3. Relocation

The previous section showed that the distance to basic services has decreased overall. The present section explores information related to household relocation. In this regard, Table 4.11 shows that in 2013-14, 75% of households reported having lived in a different dwelling prior to shifting to the one they currently occupy; which displays an increase of three percentage points since 2010-11. The most notable observation is that households are relocating at an increased rate since 47% in 2010-11 had spent less than five years in their current dwelling compared to 50% in 2013-14.

4.4. Dwelling ownership and rent arrangements

The follow section examines the trend in status of ownership of dwelling between the two surveys. Table 4.13 shows that the majority of households in Rwanda in 2013-14 own their dwellings (81%) i, while (13.5% live in rented dwellings. However, the percentage of households owning their dwelling has slightly reduced by 3 percentage

points in 2013-14. Tenancy/ renting is most common in the richest quintile (28%) compared to other quintiles.

Source: EICV3. Base population: all households.

The section on dwelling ownership and rent arrangements revealed that in Rwanda, the majority of households own their dwellings. Estimates in Table 4.14 provide detailed information on the owner of the dwelling whereby the general trend points towards joint ownership of the head and his/her spouse. More than half of houses is jointly owned (58%) in 2013-14, which is an increase of eleven percentage points from 2010-11(47%). The proportion of households with house joint ownership is much higher in rural areas (59%) than in urban areas (50%). A similar trend appears at provincial level where joint ownership is much higher in the Northern Province in both surveys (53% in EIC3 and 65% in EICV4) compared to other provinces.

Source: EICV3. Base population: households owning their dwelling.

With reference to demographic and income characteristics, Table 4.15 shows that households owning their dwelling are distributed almost equally across the different wealth quintiles (varies in the range of 18-22% in EICV4). A close analysis reveals that renting of dwellings is mostly common in highest quintiles (50%) compared to the lowest quintiles. In addition, the proportion of households renting their accommodation is predominantly found within the age group of 20–39 in both surveys (around 75%).

4.5. Ownership of home assets (Refrigerator and cooking machine)

The survey captures information on ownership of durable assets by households. Table 4.16 shows the proportion of households owning at least one refrigerator and cooking machine to be 1.5% and 0.5% respectively at national level. Ownership of refrigerator is most common in Kigali city (9%) compared to other provinces and in modern planned areas (19%) compared to other types of habitat.

Chapter 5: Transport

This chapter deals with households' perceptions of the transport infrastructure in their communities. The main mode of transportation in Rwanda is by road. EICV surveys provide information on household perception of: - distance to transport infrastructure, the use or non use of transport infrastructure and perceptions about any change in quality of the infrastructure. In addition this section also provides information on trend in household ownership of assets used for transportation such as vehicles, motorcycles and bicycles between 2010-11 and 2013-14.

5.1. Household perceptions of transport infrastructure

This focuses on two transport amenities: all-weather roads and public transport stages. Table 5.1 shows that the proportion of households accessing all-weather roads regularly or often increased by three percentage points to 96% in 2013-14 at national level. The lowest usage rate is observed in the Western province, where 9% of households reported use of all-weather roads sometimes or not at all in 2013-14. This is in line with information shown in Figure 5.1.

Figure 5. 1: Usage rates for all-weather roads in rural areas, EICV4

Figure 5.2 shows that the majority of rural households in Rwanda are within 20 minutes walking distance from an all-weather road. An upward trend is observed in all provinces as shown in Table 5.2. However, the Western province retains the lowest percentage of households accessing all-weather road in less than 20 minutes in both surveys (62% in EICV3 and 76% in EICV4).

Table 5.2: Walking distance to nearest all-weather road, by province, urban/rural and quintile

Note: Estimates may differ slightly from what reported in EICV3 Thematic report as HHs that "never use" a service are excluded from the base population in EICV4 and the indicator for EICV3 has been re-calculated using EICV4 Methodology.

Figure 5. 2: Percentage of rural HHs that can walk to an all-weather road in less than 20 minutes

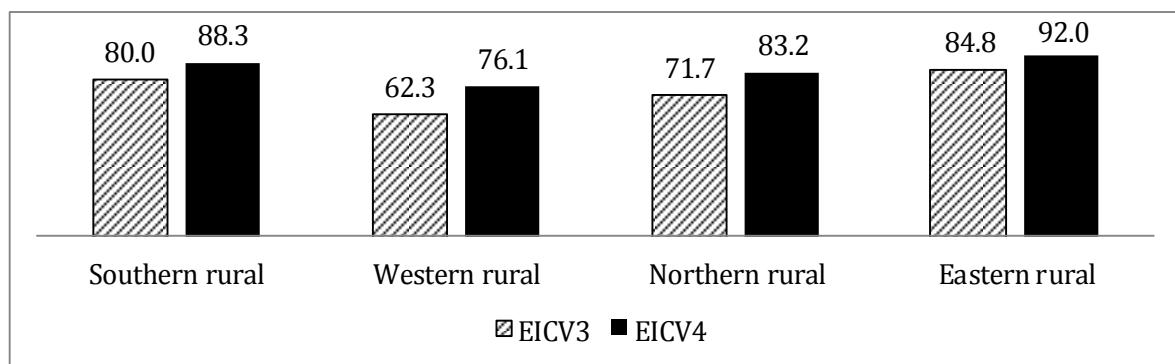

Table 5.3 presents the reasons reported by households for non-frequent or non-use of roads. It is observed that 15% of households do not use all weather roads due to the long distance while 71% stated that they did not need it frequently.

Table 5. 3: Reasons for not using all-weather road, by urban/rural and quintile

Concerning user satisfaction, Table 5.4 shows at national level, 77% of households are satisfied with their nearest all-weather road compared to 65% in EICV3, generally, it is clear that the user satisfaction level increased at a rate of twelve percentage points. The highest user satisfaction is observed in the Eastern province (82%) and the lowest is in the Western province (70%) in 2013-14. Regarding perceptions of changes in quality of all-weather roads, 35% of respondents observed an improvement while 59% feel that the quality has remained the same. 6% observed a decline in quality over the past 12 months in 2013-14.

Source: EICV3. Base population: households using a particular service sometimes, regularly or often. Note :(1) Note: Figures differ from the EICV3 Thematic report as HHs that "never use" a service are excluded from the base population in EICV4 and the indicator for EICV3 has been re-calculated using EICV4 Methodology.

Table 5.5 presents data on the usage of public transport stages. 82% of households in urban areas reported using public transport stage regularly or often in 2013-14 compared to 43.5% in rural areas. The highest usage rate of public transport stages was in Kigali city (86%) while the lowest usage rate is observed in the Western province, where 66% of households reported that they use public transport stages sometimes or not at all. This associates with information presented in Figure 5.3.

Figure 5. 3: Usage rates for public transport stages in rural areas, EICV4

Source: EICV4. Note: The summation of % is not added up to 100 due to other percentage occupied by the households that don't know about the service

Table 5. 5: Usage rates for public transport stage, by province, urban/rural and quintile

Source: EICV3. Base population: all households.

With regard to walking distance to the nearest public transport stage, Table 5.6 shows that in rural areas only 18% of households walk for less than 20 minutes to a public transport stage compared to 65% in urban areas. The Western and Northern Provinces display the lowest percentage of households having access to a public transport stage in less than 20 minutes (around 17%). Access to a public transport stage in less than 20 minutes is continuously skewed towards the richest quintile in both surveys.

Table 5. 6: Walking distance to nearest public transport stage, by province, Urban / rural and quintile

Table 5.8 presents data on the user satisfaction levels of households that use public transport stages. Overall, 82% of households are satisfied, which is an increase of ten percentage points to 72% in 2010-11. The level of user satisfaction in urban areas is higher (87%) compared to rural areas (80%).

40% of respondents perceived that the quality of public transport stages has improved, and 56% feel that the quality of public transport stages has remained the same, while only 2.5perceived a decline in quality over the last 12 months in 2013-14.

Table 5.8: User satisfaction with public transport stage and perceptions of changes in quality over last 12 months, by province, urban/rural and quintile

5.2. Ownership of transportation assets (vehicles bicycles, motorcycles)

This section reports on ownership of transport assets for private not commercial use. Table 5.9 shows that ownership of bicycles, motorcycles and cars in 2013-14 stands at, 16%, 1% and 1% respectively at national level. In Kigali city, the proportion of households owning at least one car has slightly decreased from 6% to 5% in 2013-14. Motorcycles and cars are owned entirely by the richest quintile in both surveys.

Chapter 6: Information and Communication Technology

This chapter discusses the trends in household ownership of Information and Communication Technology (ICT) devices (like mobile phones computer, etc). Furthermore, it presents information on distance, usage rates and level of user satisfaction of ICT services while comparing 2010-11 and 2013-14.

6.1. Ownership of ICT devices and internet access

This section presents data at the household level. Ownership in this case refers to at least one member of the household with the ICT device. Therefore, estimates of ICT penetration at household level presented in this chapter may be higher than the penetration at individual level. Table 6.1 shows that 64% of households own at least one mobile phone, and ownership rate in 2013-14 is highest in Kigali (90%) followed by the Eastern Province (67%). The highest proportion of mobile phone owners fall within the richest quintiles in both surveys.

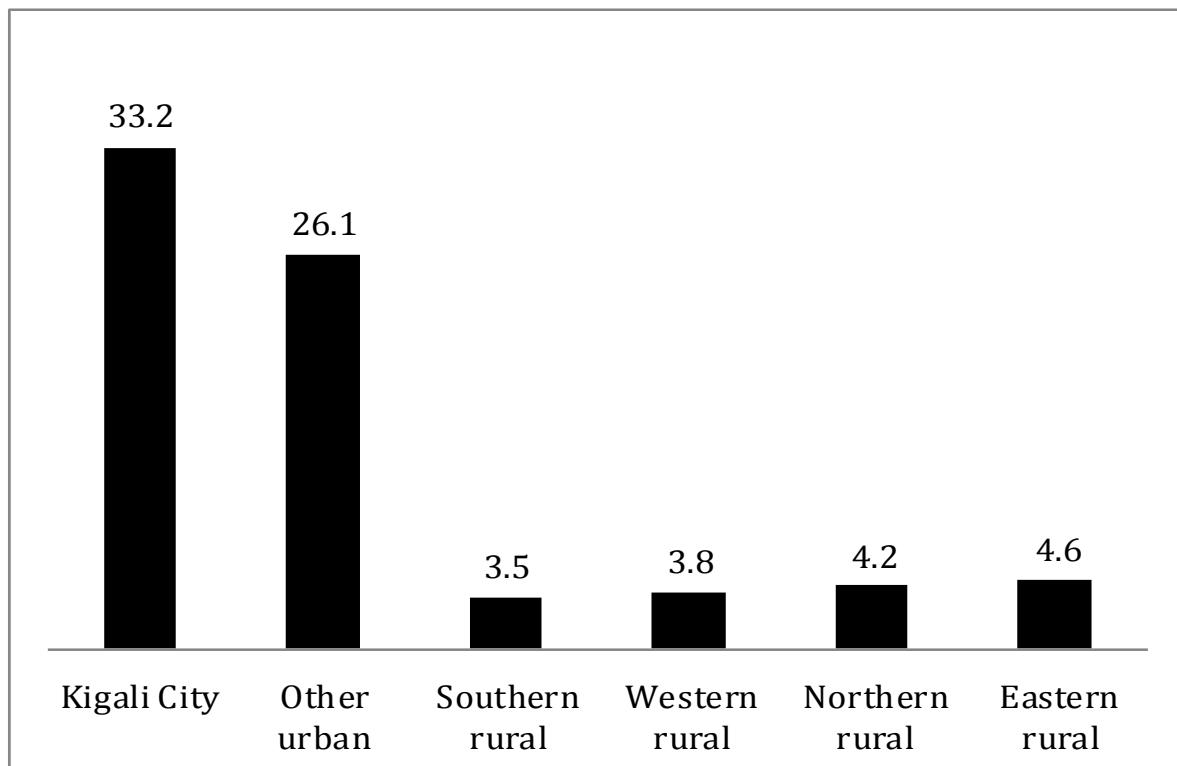

Figure 6.1 which shows trend in ownership of ICT devices between 2010-11 and 2013-14 reveals an increase across all devices except radios which remained the same.

Figure 6. 1: Changes in ownership of ICT devices

Source: EICV4 and EICV3. Base population: all households.

The survey provides also information on private internet access². As shown in Table 6.2 and Figure 6.2 below, 33.5% of urban and 4% of rural households have access to the internet at home. This is mostly predominantly in the highest quintile (30%) while less than 7% among the bottom quintiles can access internet from home. Mobile phones are the most common used modes of accessing internet at home (81%) followed by modems (18%). Only 1% of households access internet at home using wireless in 2013-2014.

² Estimates in Table 6.2 cannot be compared to those reported in EICV3 Thematic report given that , in EICV4 the household was asked to report the main type of internet connectivity used with possibility of reporting only one type whereas, in EICV3 household could report different types of internet connectivity being used . Therefore, EICV4 and EICV3 are not comparable.

6.2. Computer literacy

This section discusses computer literacy in the overall population and usage level of public ICT facilities. Table 6.3 shows that only 7% of the population feels confident about using a computer. In urban areas 23% of the population feel confident about using a computer in 2013-14 compared to 4% in rural areas. Men are more computer literate (9%) than women (6%).

Source: EICV3. Base population: all persons aged 10 and above. Note: The survey assumes that illiterate persons do not use computers.

In addition, with regard to age group Figure 6.3 shows that the highest computer literacy rates are observed in the age group ranging between 15 and 34.

³ Notes: (1) In EICV4 the base population for this indicator are persons aged 10 and above while for EICV3 were persons aged 6 and above. Therefore, estimates for EICV3 were re-calculated for consistency purpose. (2)For EICV3 estimates, those who never used a computer and those who used a computer before but felt not confident to use it again are combined to form those who are unable to use a computer.

Figure 6.3: Percentage of population (10+) that feels confident about using computer, by age group

Source: EICV4 and EICV3

6.3. Public ICT facilities

This section focuses on usage rates and satisfaction levels with public internet service facilities and phones. Table 6.4 shows that only 2% of Rwandan households use public internet facilities (regularly and often) in 2013-14 compared to 4% in 2010-11. The highest usage rate is found in Kigali (7%) compared to other provinces. A striking finding that emerges from comparing both surveys is that using public internet facilities in urban areas has significantly decreased from 21% in EICV3 to 9% in EICV4. This might be explained by the increased use of private internet sources observed in the previous section.

Table 6. 4: Usage rates for internet service facility, by province, urban/rural and quintile

Source: EICV3. Base population: all households.

Table 6.5 provides information on the satisfaction levels among the households that use public internet services. 92% of households are satisfied with their nearest internet services, which is an increase of nine percentage points in 2013-14 compared to 83% in 2010-11. The high satisfaction rate is spread evenly across all regions of the country. 39% of households perceived an improvement in quality of public internet services in 2013-14 and 56% feel that the quality has remained the same.

Table 6. 5: User satisfaction with internet service facility and perceptions of changes in quality over last 12 months, by province, urban/rural and quintile

Source: EICV3. Base population: households using a particular service sometimes, regularly or often. Note: Figures differ from the EICV3 Thematic report as HHs that "never use" a service are excluded from the base population in EICV4 and the indicator for EICV3 has been re-calculated using EICV4 Methodology.

With reference to the use of public telephones, Table 6.6 shows that the proportion of households using public phones regularly or often reduced from 19% to 6% in 2013-14 at national level. This can be explained by the increased ownership of mobile phones observed in the previous section. Public phones usage rate in urban areas is higher (12%) than those in rural areas (5%) in 2013-14.
