National Institute of Statistics of Rwanda (NISR), Agricultural Household Survey 2017 report, December 2018

Foreword

Agriculture statistics are useful for monitoring progress on agriculture programs and policies in Rwanda. The government of Rwanda needs updated information on agriculture in order to assist in addressing key agricultural issues and information needs that will inform policy makers and other stakeholders and allow more effective identification of priority intervention needs. In 2017, National Institute of Statistics of Rwanda (NISR), in partnership with the Ministry of Agriculture and Animal Resources (MINAGRI) introduced Agricultural Household Survey (AHS) for the first time, to provide needed agriculture statistics that are not covered in Seasonal Agricultural Survey.

The main goal of the Agricultural Household Survey is to collect data on socio-economic characteristics of agricultural households, extension services, implementation of agriculture policies and programs in agricultural households, use of agricultural inputs, agricultural practices, livestock and other related agricultural items.

This published report of Agricultural Household Survey (AHS) conducted from July to September 2017, has been done to provide current data showing the situation of agriculture in households and it is a tool to be used in planning and monitoring of agriculture policies and programs.

Special recognition must be given to the delegation of the European Union (EU) to Rwanda for their continuous interest, steadfast support and addition funding and technical assistance that enabled to conduct this survey. National Institute of Statistics of Rwanda also express its gratitude to all NISR staff and other partners who contributed tirelessly in one way or another, for the job well done.

NISR invites policy makers, partners, the general public, researchers and all users to value and use optimally the findings of this report to contribute to Rwandan Agriculture development.

Yusuf MURANGWA
Director General, NISR

Executive summary

National Institute of Statistics of Rwanda conducted for the first time the Agricultural Household Survey (AHS) in 2017. The survey aimed at capturing conditions of agricultural households of the country in the context of agriculture policies and programs of the Government of Rwanda. NISR intend to conduct this survey every three years. Findings presented in this report come from data collected in 16,057 agricultural households throughout the country from Mid-July to September 2017. In this survey Computer-Assisted Personal Interviewing (CAPI) technique was used in order to improve the speed of delivery and quality of data.

This report presents findings from AHS 2017 in areas of various aspects related to demographic and socio-economic characteristics of agricultural households, crop production, use of agricultural production, awareness of agriculture technology, government policies and programs, access to inputs, access to finance, agricultural assets, livestock numbers and other related agricultural items.

In this report, majority of tables provide results of AHS 2017 discussing different patterns across provinces and districts of Rwanda. Also, some tables results have been disaggregated for male and female-headed households to explore gender related aspects in key social and economic characteristics of agricultural households in Rwanda.

Socio-economic characteristics of agricultural households

According to the 2017 Agriculture Household Survey (AHS), during the Agricultural year September 2016 - June 2017, Rwanda had an estimated 2.1 million agricultural households. This constitutes about 80.2 percent of total estimated households of the country. Out of total agricultural households, 27.8 percent were headed by female. During this agricultural year 78.6 percent of all households in Rwanda were engaged in crop production, whereas 62.6 percent of households engaged in livestock. Of the estimated 2.1 million agricultural households in Rwanda, 76.4 percent have main activity of crop production and livestock, followed by 21.8 percent whose main activity is crop production and 1.8 percent exclusively in livestock production. Average size agricultural household is 4.5.

Out of the total estimated 9.7 million of Rwandan living in agricultural households, 47.2 percent were males while 52.8 percent were females. 46.5 percent of total agricultural households' population are in age of below 16 years (below working age). The working age population (16 years old and above) equivalent to 5.4 million people. This represents 53.5 percent of the total population living in agricultural households. Out of 5.4 million agricultural households' working population, 55.5 percent had primary school education level, 17.2 percent secondary school education level, 1.9 percent tertiary education level while 25.4 percent have no education level. Among agricultural population, 21.1 percent of male are not educated, while 28.9 percent of female.

Economic activity of agricultural household members

Agriculture Household Survey defines an agricultural household working population as people having at least 16 years old and the main activity of the household is agriculture. Out of the estimated 5.4 million agricultural households' working population 54.4 percent were females. Considering the economic activities, results show that 70.2 percent of agricultural household working population practice agricultural activity only, 11.6 practice activities other than agriculture, 2.1 percent do both agricultural and non-agricultural activities while 16.2 percent have no activity. Furthermore, it was estimated that 65.8 percent of 3.9 million of agricultural households' working population (those practice agriculture activities only and those mixing with other non-agriculture activities) practiced both crop production and livestock activities.

Agricultural land ownership and use

65.3 percent of farmers cultivated in the households' farms, while 32.3 percent cultivated in both their own households' farms and non- households' farms. Furthermore, it has been revealed that use of land of agricultural land does not vary too much in both agricultural seasons with 93.1 percent of agricultural households in Season A 2017 and 94.2 percent in Season B 2017.

Crop cultivation and production use

Results show that among major five crops grown in 2017 season A in Rwanda, bush bean was grown by 52.9 percent of crop cultivating households, followed by maize by 50.9 percent, climbing bean by 36.0 percent, sweet potato by 24.9 percent and cassava by 23.7 percent. For

season B 2017 bush bean was grown by 48.8 percent of crop cultivating households, followed by climbing bean by 33.5 percent, maize by 28.3 percent, sweet potato by 24.9 percent and sorghum by 23.3 percent. In Season A and B 2017, the high ratio of the production quantity of cash crops such as tea, coffee, macadamia and pyrethrum were doomed to be sold followed by fruits, vegetables, cereals (paddy rice and wheat) and dessert banana. On the other hand, beans, sweet potato, cassava, yams, taro, some vegetables and fruits were predestined for own consumption. In 2017, 58.1 percent and 56.8 percent of crop producing households were involved in market-oriented agriculture in season A and B respectively. Agricultural household headed by males were more involved in market-oriented agriculture (60.8 percent and 58.9 percent in season A and B respectively) compared to household headed by females (51.2 percent and 51.5 percent in season A and B respectively).

Agricultural cooperative membership

The survey results show that, in the whole country 12.5 percent of agricultural households have at least one member belonging to agricultural cooperative.

Agriculture extension services and programs

29.6 percent of agricultural households have received agricultural extension services. The Northern Province has the highest number of beneficiaries with 33.6 percentage of agricultural households with at least one person who received agricultural extensions. Crop production extension services were most received at 88.9 percent.

In regards to agricultural programs, results show that 13 percent of agricultural households belong to Twigire muhinzi, 4.2 percent of all agricultural households have got contract farming, 13.0 percent of agricultural households rear a cow from GIRINKA Program and 44.4 percent of all agricultural households (2.1 million) have a kitchen garden.

Access to saving and credit and funds

Access to agricultural credit or funds is widely a major factor to development of agricultural households. AHS 2017 shows that countrywide, 49.6 percent of all agricultural households had at least one member having bank account. 4.7 percent had at least one household member who requested agricultural loan. Out of requested agricultural loan, 96.3 percent of them have been approved.

Agricultural inputs and equipment use for agricultural production

Survey results reveal that, in season A 2017, 79.3 percent of agricultural households, used organic fertilizers compared to 62.7 percent in season B while 31.6 percent used inorganic fertilizers in Season A 2017 compared to 23.7 percent in season B 2017. In regards to the use of pesticides, results show that 17.3 percent of agriculture household applied pesticides in Season A 2017 compared to 17.9 percent in season B 2017, while the use of lime was at 2.9 percent and 1.8 percent in season A and B of 2017 respectively. Results also revealed that 23.9 percent and 31.7 percent of agricultural households use improved seeds in season A and B of 2017 respectively.

Agricultural practices

AHS 2017 results show that 10.1 percent of agriculture households practice irrigation, while 65.7percent practice anti-erosion control measures.

Livestock

Results show that 1.7 million of household have raised at least one livestock. Furthermore results show that livestock ownership is distributed as follows: 61 percent of households own cattle, 53.6 percent with goats, 33.7 percent with hens, 30.6 percent with pigs, 18.1 percent with sheep, 15 percent with rabbit, 7.4 percent with duck and 6.6 percent with turkey. The survey results also show that, 2 million liters of milk are produced every day and 36.7 percent of the production is own-consumed, 32.7 percent sold to others, 18.4 percent sold at milk collection center, 7.9 percent given to others ,3.2 percent damaged while1.1 percent are used in other way.

Main Agricultural household survey indicators

No	Indicator	AHS 2017
1	Percentage of agricultural households over total number of households in Rwanda during agricultural year 2017	80.2
2	Percentage of households engaged in crop production	78.6
3	Percentage of households engaged in livestock	62.6
4	Percentage of agricultural households whose main activity is both crop production and livestock during agricultural year 2016/2017	76.4
5	Percentage of agricultural households whose main activity is crop production only during agricultural year 2017	21.8
6	Percentage of agricultural households whose main activity in livestock only during 2017	1.8
7	Percentage of female agricultural households' population	52.8
8	Average agricultural household size	4.5
9	Percentage of agricultural households with at least five household members	46.0
10	Percentage of agricultural households headed by females	27.8
11	Percentage of working age agricultural households' population	53.5
12	Agricultural household's population over 15 years who do farming activity only	70.2
13	Percentage of agricultural households who cultivated owned land during 2017 agricultural year	93.6
14	Percentage of agricultural households engaged in market oriented during 2017 agricultural year	57.5
15	Percentage of agricultural households belonging to agricultural cooperative or association	12.5
16	Percentage of agricultural households with at least one person who received agricultural extension	29.6
17	Percentage of agricultural households belonging to Twigire muhinzi group	13.0
18	Percentage of agricultural household who have got contract farming during 2017 agricultural year	4.2
19	Percentage of agricultural households who reared cow from GIRINKA Program	13.0
20	Percentage of agricultural households who had a kitchen garden	44.4
21	Percentage of agricultural households with at least one member had bank account	49.6
22	Percentage of agricultural households with at least one member requested agricultural loan during 2017	4.7
23	Percentage of agricultural households whose requested loan has been approved during 2017	96.3
24	Percentage of agricultural households who received funds for agricultural purpose	5.7
25	Percentage of agricultural households who used organic fertilizer during season A 2017	79.3
26	Percentage of agricultural households who used organic fertilizer during season B 2017	62.7
27	Percentage of agricultural households who used inorganic fertilizer during season A 2017	31.6
28	Percentage of agricultural households who used inorganic fertilizer during season B 2017	23.7
29	Percentage of agricultural households who used pesticides during season A 2017	17.3
30	Percentage of agricultural households who used pesticides during season B 2017	17.9
31	Percentage of agricultural households who used lime during season A 2017	2.9
32	Percentage of agricultural households who used lime during season B 2017	1.8
33	Percentage of agriculture households who use improved seeds during season A 2017	23.9
34	Percentage of agriculture households who use improved seeds during season B 2017	31.7
35	Percentage of agriculture households who practice irrigation during 2017 agricultural year	10.1
36	Percentage of agriculture households who practice erosion control measures	65.7
37	Percentage of livestock-owning households rearing Cattle	61.0
38	Percentage of livestock-owning households rearing goats	53.6
39	Percentage of livestock-owning households rearing sheep	18.1
40	Percentage of livestock-owning households rearing pigs	30.6
41	Percentage of livestock-owning households rearing hen	33.7
42	Percentage of livestock-owning households rearing Duck	7.4
43	Percentage of livestock-owning households rearing Turkey	6.6
44	Percentage of livestock-owning households rearing Rabbits	15.0

1. INTRODUCTION

Agriculture Household Survey (AHS) was conducted by the National Institute of Statistics of Rwanda. The reference period for data collection was the agricultural year September 2016 – June 2017. Data was collected from July to September 2017. The survey covered all 30 districts of Rwanda.

The survey aimed at capturing the conditions of agricultural households of the country in the context of policies and programs of Government of Rwanda. It was designed to collect information on various aspects related to socio-economic characteristics of agricultural households, economic activity of agricultural household members, crop production, livestock, awareness of agriculture technology and government policies and programs, access to inputs, access to finance, agricultural assets, use of agricultural production and livestock number and other related agricultural items.

This survey was conducted among private agricultural households, in 4 strata used in Seasonal agricultural survey. Households were listed from the 1,560 sampled segments in the country. Among the listed households 16,057 households were found the ones applying agricultural activities. A single visit was done in every identified agricultural household and the information collected covered two agricultural seasons A and B.

2. METHODOLOGY OF CONDUCTING THE AGRICULTURAL HOUSEHOLD SURVEY

2.1 Open segment approach in collecting household-based data

In 2017, NISR used the multiple sampling frame to conduct Seasonal Agricultural Survey whose purpose was to collect accurate area-based data at district level, such as land use, crop area, production, inputs use, agricultural practices and other farm related agriculture information. To gather such information, closed segment approach was used where only farms inside the segment are recorded. According to FAO 1996¹ it is recommended to use the open segment approach to collect data related to household-based socio-economic variables and livestock. In the open segment approach, information on the whole farm is required for all farms having their residence inside the segment. In this approach the dwellings(households) within the

¹ FAO 1996, Multiple frame agricultural surveys, Volume 1, Current surveys based on area and list sampling methods.

segment are listed and surveyed. It is in this regards that NISR conducted the Agricultural household survey 2017, using open segment data collection approach in order to provide agricultural household-based socio-economic characteristics and livestock in Rwanda.

2.2 Target population

The objective of Agricultural household survey 2017 to provide data on agricultural household-based socio-economic characteristics and livestock in Rwanda. The target population, from which a sample is drawn, consisted of all households as well as those in urban areas where agriculture is an important livelihood strategy. The unit of analysis for the Agricultural household survey was the agricultural household.

2.3 Sample size and distribution

In the sampling strategy of the SAS 2017, it was proposed that 960 PSUs be selected in the first instance by systematic sampling method with probability proportional to size. At the second stage the sampled PSUs were divided into SSUs among which only one SSUs was sampled at random for each PSU and used for the survey. 960 segments were drawn from three agricultural strata including intensive agriculture land on hillsides (stratum 1.1), intensive agriculture land in marshlands (stratum 2.0), rangelands (stratum 3.0). Using the open segment obliges to include urban strata in the sampling frame. Apart from stated strata, village stratum which combines two substrata; urban area (stratum 4.1) rural settlements (stratum 4.2) was added to the sample frame. This stratum was divided into segments and a sample of 600 segments was drawn by systematic sampling method. It should be mentioned that the Stratum 4.1 and 4.2 were specially added to the purpose of having a complete sampling frame for estimation of livestock since a major portion of livestock are associated with households located in villages and rural urban area adjacent to grazing land that had previously been missing for all of the previous SAS area sampling frames.

2.4 Data collection

Data collection has been done into two phases:

a) Listing of households

A total of 1,560 sampled segments were utilized for enumeration of all households within each segment. After identifying a dwelling (household) enumerators through reading the definition of household to the household head, identify the number of households in that dwelling record the information on household's main activity.

By definition, a household is composed of the group of people living in the same dwelling space who eat meals together and acknowledge the authority of a man or women who is the head of household.

Particular cases

- 1) In a polygamous household where all the spouses do not live in the same concession as their husband, each of the spouses living elsewhere was listed as a separate household with the persons they live with (the spouse being the head of that household).
- 2) A tenant who does not take his meals where he lives is considered as a separate household.
- 3) In a case where a man lives in a concession with his spouse(s) and his children among which some are married, each of the married sons with his spouse(s), his children, and other unmarried dependents under his responsibility, they form a separate household.
- 4) In a group of unmarried people living together where everyone has his own means of livelihood, each member of the group will form his own household.

An agricultural household was defined as a household whose largest source of income is derived from agricultural production (crop production and/or livestock).

Each household was asked if there is at least one household member who was engaged in cropping or/ and livestock during the agricultural year 2016/2017. Finally, 23,419 households in sampled 1,560 segments were listed. From that list, 16,057 households from which at least one member did crop and/or livestock during 2016/2017 agricultural year were identified and interviewed for variables of agricultural household 2017. The household head was the one selected for responding on behalf of the whole household.

Table 2 : Number of sample agricultural households(unweighted) in AHS y by province and districts

Provinces and districts	Number of listed households	Number of surveyed agricultural households	Share of surveyed agriculture households at national level

b) Interview for agricultural households

After identifying the agricultural households from listing, all of them were interviewed and records were taken using survey instruments.

Survey instruments

The survey instrument was designed with a common set of core modules on household composition, household members' characteristics, household members' economic activity, land tenure and crops planted during agricultural year 2016-2017, agriculture extensions and programs, access to savings and credits, inputs, use of production, storage facilities, and livestock.

The questionnaire was designed in CPro software to facilitate electronic data collection. Tablets were used to collect data

Weight calculations

Weight calculation for strata 4.1 and 4.2

For strata 1.1, 2.0 and 3.0, the sampling of segment was done through two stages and probabilities were calculated for each sampling stage. Weight is inverse of the overall probability of selection

At first stage PSUs within each stratum selected with probability proportional to size (PPS) based on area of PSU

The probability of selecting the PSU was calculated as follows:

$$p_{1hi} = \frac{n_h \times A_{hi}}{A_h}$$

Where:

- p_{1hi} = first stage probability of selection for the i-th sample PSU in stratum (district and land use stratum) h
- n_h = number of PSUs selected in stratum h
- A_{hi} = area of i-th sample PSU in stratum h
- A_h = total area of stratum h

At second stage PSUs were divided into SSUs and only one SSU was selected. The probability of selecting the segment (SSU) was calculated as follows:

$$p_{2hi} = \frac{1}{S_{hi}}$$

where:

- P_{2hi} = second stage probability of selection for the i-th sample SSU in PSU (district and land use stratum) h
- S_{hi} = total number of segments in the i-th sample PSU of stratum h

Weight of the segment in strata 1.1,2.0 and 3.0

$$W_{Shi} = \frac{1}{p_{1hi} \times p_{2hi}}$$

Weight calculation for strata 4.1 and 4.2

For strata 4.1 and 4.2 The sampling followed one stage where a stratum has been divided into Segments and

The probability of selecting the SSU (segment) was calculated as follows:

$$p_{hi} = \frac{n_h \times A_{hi}}{A_h}$$

Where:

- p_{1hi} = first stage probability of selection for the i-th sample PSU in stratum (district and land use stratum) h
- n_h = number of PSUs selected in stratum h
- A_{hi} = area of i-th sample PSU in stratum h
- A_h = total area of stratum h

$$W_{Shi} = \frac{1}{p_{hi}}$$

2.5 Data analysis

Socio-economic characteristics of household members like age, gender, education and economic activity were analysed at individual level, while for other indicators the household was the analysis unit. Some indicators were reported at National level others at province level and others were done at district level, basing on representability at each administrative unit.

3. SURVEY FINDINGS

3.1 Socio-economic characteristics of agricultural households

This section investigated current information related to agricultural households' numbers, sex, agricultural population age groups, education and household size across geographical areas.

3.1.1 Agricultural households' numbers

According to AHS2017 results, it was estimated that during agricultural year 2016/2017 there was a total of 2.1 million of agricultural households in the country which is equivalent to 80.2 percent of total estimated country households. In this agricultural year, 78.6 percent of all households in Rwanda were engaged in crop production, whereas 62.6 percent of households engaged in livestock. (See Table 3). In regards to main activity of agricultural household, 76.4 percent of households practice mainly crop and Livestock production, 21.8 percent practice solely crop production while 1.8 percent practice exclusively livestock (See table 4).

Table 3 : Percentage of households who engaged in different agricultural activities during agricultural year 2017

Province	Percentage of agricultural households	Percentage of households engaged in crop production	Percentage of households engaged in livestock	Total number of estimated households (000s)
Kigali city	28.6	26.3	16.1	328
South	88.5	87.3	72.0	652
West	86.1	83.0	68.7	533
North	90.0	89.1	72.8	474

3.1.2 Agricultural households' population by Sex

Table 5 shows the distribution of agricultural household population by sex and province. During the agricultural year 2016/2017, the total population of Rwanda living in agricultural households was estimated to be 9.7 million, of whom 47.2 percent were males and 52.8 percent were females.

Kigali city has a slightly lower percentage of females compared to other provinces (51.8 percent), while a percentage of females is slightly higher in Northern Province compared to other provinces (53.8 percent).

Table 5 : Percentage of agricultural households' population by sex and province

Province	Agricultural household population (000s)	Sex		Total
		Male	Female	
Kigali city	436	48.2	51.8	100
South	2,449	47.0	53.0	100
West	2,194	47.2	52.8	100
North	1,837	46.2	53.8	100
East	2,767	47.8	52.2	100
Rwanda	9,682	47.2	52.8	100

Source: NISR, AHS 2017

Table 6 shows that of the total agricultural household population, 44.6 percent are in age below 16 years, 24.8 percent are aged from 16 to 30 years, 26.8 percent are aged from 31 to 64 years and the rest are aged 65 years and above.

For the total male household members 46.5 percent are under 16 years old, 24.9 percent are 17 to 30 years of age, 25.5 percent range between 31 to 64 years of age while the rest are 65 years and above. Female household members ages are distributed as follows: 42.9 percent are under 16 years old, 24.7 percent are between 17 to 30 years of age, 27.9 percent range between 31 to 64 years while the rest are 65 years and above. The same table revealed that people below 16 years represent a high number of household population (44.6 percent).

Table 6 : Percentage of agricultural households' population by sex, age group and province

3.1.3 Education

This section explores key education indicators and compares them across gender, province and age group. Educational attainment is a key factor for agricultural household as it is key to improve agricultural practice in household and in the community as well.

Table 7 shows that out of 5.4 million of working age agricultural households' population, 55.5 percent has primary education level, 17.2 percent secondary education level, 1.9 percent tertiary education level while 25.4 percent have not attended school. 21.1 percent of male agricultural population have not attended school, which is slightly lower compared to 28.9 percent for female agricultural households' population.

Table 8 shows that out of 6.8 million representing agricultural households' population aged 10 years and above, 61.9 percent attained primary school, 15.1 percent secondary school, 1.5 percent university while 21.5 percent had no education. National wide, among agricultural households' population who attained primary and secondary schools, females are 51.8 and 52.5 percent respectively. In contrary a high percentage of males attained tertiary schools (59.7percent). For agricultural households' population 61.0 percent of people who have not attained school are females.

Table 7 : Percentage of agricultural households' population aged 16 and above by sex, education and province

Province	Sex															Number of agricultural households' population aged 16 years and above (000s)

3.1.4 Agricultural household size

Table 10 shows that, at national level, the average size of agricultural households is 4.5. Western province is the highest in terms of agriculture household size, with 4.8 members. The same table shows that male-headed households are larger with 4.9 members on average, compared to 3.4 members on average for female-headed households.

Table 10 : Average size of agricultural households by sex of household head and province

Province	Household head sex		Overall average size	Number of agricultural Households (000s)
	Male headed	Female headed		
Kigali city	4.9	3.7	4.6	94
South	4.6	3.4	4.2	577

3.2 Economic activity of agricultural household members

The working population in agriculture is an engine to contribute to the productivity of the national economy. This section summarizes survey findings related to categories of economic activity of agricultural households. It is disaggregated to population gender, education and age.

Table 13 shows that the estimated agricultural households' population at working age (16 years and above) was 5.4million of which female represents 54.4 percent while male represents 45.6 percent. The distribution of the above-mentioned population by economic activity shows that 70.2 percent practice agricultural activity only, 11.6 practice activities other than agriculture, 2.1 percent do both agricultural and non-agricultural activities while 16.2 percent do not work.

Within population that practice agricultural activities only, females represent 60.5 percent, while for those who are in activities other than agriculture males represent 69.9 percent. Among a population who does both agricultural and non-agricultural activities, males represent 66.5 percent. For non-working population males represent 52.0 percent while females represent 48.0 percent.

Table 13 : Distribution (%) of agricultural households' population from 16 years and above by economic activity, sex and province

Province	Agricultural activity only			Non-agricultural activity			Both agricultural and non-agricultural activities			No activity			Overall					Total agricultural population over 15 years (000s)	Percentage of female in Total agriculture population over 15 years

As Table 20 shows that, across seasons, 93.1 percent and 94.2 percent of agriculture households operated in their own land in season A and B of 2017 respectively, while the rest rented land either by paying cash or by share of production or free renting. Apart from operating the owned land 31.7 percent of agricultural households in Season A 2017 and 29.7 percent in Season B 2017 accessed land they operated by paying cash.

Table 20 : Percentage of agricultural households who owned or rented agricultural land in different means by agricultural season, province and sex of household head

3.4 Crop cultivation and production use

This section presents the cultivation decisions made by agricultural households across different provinces and the use of production in both season A and B of the agricultural year 2017.

3.4.1 Crop cultivation

Table 21 and Table 22 shows the percentage of crop producing households cultivating different crops. Table 20 reveals that, among major five crops grown in 2017 season A in Rwanda bush bean was the most grown crop (52.9percent of crop cultivating households), followed by maize (50.9percent), climbing bean (36.0percent) sweet potato (24.9percent) and cassava (23.7percent).

Table 21 shows that among major five crops grown in 2017 season B in Rwanda bush bean was the most grown crop (48.8 percent of crop cultivating households), followed by climbing

bean (33.5 percent), maize (28.3 percent), sweet potato (24.9 percent) and sorghum (23.3 percent).

3.4.2 Crop production use

Table 23 and Table 24 shows the use of major crops production of Season A and B of the agricultural year 2017. The main purpose of this tables was to be used in analysis of food balance sheet analysis.

In Season A and B 2017 most five crops whose high quantity was sold are cash crops (tea, coffee, macadamia and pyrethrum), fruits, vegetables, cereals (paddy rice and wheat) and dessert banana. On the other hand, beans, sweet potato, cassava, yams, taro, vegetables and fruits were predestined for own consumption.

Table 23 : Crop production use (%) in Season A 2017 at National level

Crop name	Crop production use (%)											Total
	Quantity sold	quantity used for own consumption	quantity used as wages	quantity used as farm rent	quantity used as gift	the quantity exchanged for other goods	quantity used as seeds	quantity used to feed animals	quantity stored	quantity lost after harvest	quantity used in other forms

Table 25 shows that, in 2017, 58.1 percent and 56.8 percent of crop producing households were involved in market-oriented agriculture in season A and B respectively. In season A, 60.8 of Agricultural household headed by males were more involved market-oriented agriculture compared to 51.2 percent for household headed by females. While, in season B, 58.9 percent of agricultural household headed by males were more involved market-oriented agriculture compared to 51.5 percent of household headed by females.

3.5 Agricultural cooperative membership

Agricultural cooperatives are autonomous associations of persons practicing agriculture in a united voluntarily to meet their common economic, social, and cultural needs and aspirations through a jointly-owned and democratically-controlled enterprise. Farmer groups are very crucial for they allow farmers within the group to access information on new technology, markets, prices and agricultural input. The survey investigates whether a household had at least one member belonging to agricultural cooperative. As Figure 1 show that, in the whole country 12.5 percent of agricultural households have at least one member belonging to agricultural cooperative.

Regarding agricultural cooperative type, Table 26 shows that 84.7 percent of farmers who are members of cooperative joined crop production-based cooperatives while livestock cooperative membership is still at low level with only 8.2 percent.

3.6 Agricultural extension services and programs

3.6.1 Agricultural extension services

Agricultural extension is a continuous education exercise targeting farmers where the subject matter is agricultural techniques and technology transfer to the farming community.

29.6 percent of agriculture households have received agricultural extension services. The Northern Province has the highest beneficiary with 33.6 percentage of agricultural households with at least one person who received agricultural extensions.

Among households who receive agricultural extension services, crop production extension services are largely beyond other extension services to be provided (88.9 percent of agricultural households).

Table 29 shows that during the agricultural year 2017, 88.3 percent of agricultural households received extension services related to fertilizers application, followed by 76.5 percent who received extension services related to cropping system, 32.9 percent to plant breeding 28.4 percent to crop protection and 13.2 percent who received extension services related to soil protection.

Table 30 shows that, in 2017 at national level, of all agricultural extensionists who provided crop production extension services, 40 percent were cell employees, followed by NGOs at 18.9 percent, Sector Employees at 16.1 percent, Cooperative at 8.5 percent, MINAGRI/RAB/NAEB at 6.3 percent, District Employees at 1.4 percent and Research institutions at 0.2 percent. The type of highest agricultural extension services provider of crop production services differs per province, whereby MINAGRI/RAB/NAEB was the most extension provider in Kigali city with 29.1 percent, NGOs in western province with 44.3 percent; Cell Employee in Southern, Northern and Eastern provinces with 24.3 percent, 66.1 percent and 41.2 percent respectively.

Table 31 shows that most livestock extension services received during agricultural year 2017 were animal keeping by 83.8 percent of agricultural households, followed by animal feeding by 80.5 percent, veterinary services by 46.0 percent animal sanitation by 32.6 percent and food storage by 5.6 percent.

Table 32 shows that, in 2017 at national level, of agricultural extensionists who provided livestock extension services, 51.5 percent were Sector Employees, followed 29.2 percent by Cell Employee, 4.8 percent by MINAGRI/RAB/NAEB, 4.7 percent by NGOs, 4.6 percent by Cooperative, 3.2 by District Employees and 0.2 percent by Research institutions. The type of highest agricultural extension services provider of livestock extension services differs per province, whereby MINAGRI/RAB/NAEB was the most extension provider in Kigali city with 30.9 percent, Cell employees in Eastern province with 29.0 percent, Sector Employees in

Southern, Western Northern provinces with 38.3 percent, 47.5 percent and 64.2 percent respectively.

3.6.2 Agricultural programs

Twigire Muhinzi program is designed to be operating in all Rwandan villages. The model is based on farmers to farmer extension approaches. The results from Table 33 shows that 13.0 percent of agricultural households belonged to Twigire Muhinzi groups.

Contract farming is an agricultural production carried out according to an agreement between a buyer and farmers, which establishes conditions for the production and marketing of a farm products. Table 33 also shows that 4.2 of all agricultural households have got contract farming.

A kitchen garden targets the current problem of malnutrition by sensitizing a home garden of vegetables within a family compound to fight malnutrition through vegetables consumption. Table 33 also shows that 44.4 percent of all agricultural households had a kitchen garden, and Kigali city had the lowest number of agricultural households (with 33.6 percent) with kitchen garden.

Girinka Program also known as One Cow per Poor Family aim to increase agricultural production in Rwanda, especially milk production and products, reduced high rate of childhood malnutrition and as a way to accelerate poverty reduction and integrate livestock and crop farming. Table 33 shows that country wide, of all agricultural households reared cows (1 million of households), 13.0 percent reared cow from Girinka Program and Eastern province is a head over other provinces with 21.4 percent. Female-headed households were advantageous with regards to rearing cow from Girinka Program when compared to the male-headed households (18.6 percent versus to 11.4 percent).

Table 34 shows that 13.0 percent of agricultural households who raised cows during 2017 agricultural year, raised cow from Girinka program, 2.9 percent from NGOs, 30.4 percent from friends (pass on), 27.6 percent bought and 34.5 percent own raised. As Table 35 shows, 91.3 percent of agricultural households who raised cow from Girinka program were found still raising those cows.

As Figure 2 illustrated, reasons of not still raising cows from Girinka program. Reasons reported are death by 40 percent 40.0 percent of agricultural households reported, cow stolen by 6.1

percent, cow given to others by 5.8 percent, cow replaced with other cows by 2.4 percent and cow not still being raised for unspecified reason by 8.1 percent.

Table 33 : Percentage of agricultural households who are members of Twigire Muhinzi group, get contract farming, reared cows from Girinka program and had kitchen garden by province and sex of household head

3.7 Access to saving, credit and funds

Access to saving, credit and fund for agricultural households has a major contribution to the development especially in terms of getting agricultural inputs which results in increase of production. This section presents the distribution of agricultural households with regards to ownership of bank account, access to credit and its source. Figure 3 shows that 49.6 percent of all agricultural households had at least one member having bank account.

Figure 3 : Percentage of households with at least one member had bank account during 2017 agricultural year by province

Source: NISR, AHS 2017

Table 36 shows that, countrywide 4.7 percent of all agricultural households had at least one household member who requested agricultural loan. Out of those who requested agricultural loan 96.3 percent of their request have been approved. Table 37 shows that national wide 38.9 percent of households requested loan in Tontine, followed by 35.4 percent in SACCO. The same table also shows that female-headed households works more with tontine and borrowing money from friends, compared to male-headed households, while male-headed households were more working with financial institutions.

Table 38 shows that 5.7 percent of agricultural households have at least one member received funds for agricultural purpose. In addition, it was revealed that 47.7 percent of agricultural households who got funds received them from government, 37.3 percent from friends, 11.3 percent from NGOs, and 3.8 percent from unspecified source.

3.8 Agricultural inputs and equipments use for agricultural production

3.8.1 Agricultural inputs

Table 39 shows that out of all agricultural households, 79.3 percent in Season A 2017 and 62.7 percent in season B 2017 used organic fertilizers, while 31.6 percent in Season A 2017 and 23.7 percent in season B 2017 used inorganic fertilizers. The same table shows that 17.3 percent in Season A 2017 and 17.9 percent in season B 2017 used pesticides, while 2.9 percent in Season A 2017 and 1.8 percent in season B 2017 used lime.

In regards the source of organic fertilizers, Table 40 shows that 76.6 percent of all agricultural households who used organic fertilizers in Season A 2017 and 82.8 percent in season B 2017, used their own prepared organic fertilizers.

In regards to type of organic fertilizers used, Table 41 shows that most agricultural households who reported used organic fertilizers ,49.4 percent in Season A 2017 and 53.7 percent in season B 2017 utilized compost ground manure, while 33.9 percent in Season A 2017 and 33.1 percent in season B 2017 used compost ditch.

Table 43 shows the percentage of agricultural households by source of inorganic fertilizers, for Seasons A and B 2017. For Season A 2017, 34.6 percent of agricultural households got inorganic fertilizers from government, 22.8 percent from government and market, 20.4 percent from market, 18.4 percent from NGOs and 8.5 percent from another place. For Season B 2017, 35.3 percent of agricultural households got inorganic fertilizers from government, 21.8 percent from market, 20.0 percent from government and market, 17.4 percent from NGOs and 8.6 percent from another place.

In regards to type of pesticides used, Table 44 reveals that for both seasons A and B 2017, 52.8 percent and 45.8 percent of agricultural households who used inorganic fertilizers used Cypermethrin, followed by Dithane with 35.6 percent and 38.4 percent for seasons A and B, and Rocket with 24.0 percent and 27.9 percent for season A and B respectively.

Table 45 shows the percentage of agricultural households by source of pesticides for Seasons A and B 2017. For Season A 2017, 67.7 percent of agricultural households got inorganic fertilizers mostly from market, followed by 14.1 percent from government, 12.8 percent from government and market, 7.2 percent from other place, and 1.3 percent from NGOs. For Season B 2017, 66.9

percent of agricultural households got inorganic fertilizers from government, followed by 16.8 percent from government, 12.6 percent from government and market, 5.2 percent from other place, and 0.8 percent from NGOs.

Table 46 shows that out of all agricultural households, 98.7 percent in Season A 2017 and 98.8 percent in season B 2017 used traditional seeds, while 23.9 percent in Season A 2017 and 31.7 percent in season B 2017 used Improved seeds. For both season A and B, male-headed households were more to use improved seeds, comparing with female-headed households.

Table 47 shows that for Season A 2017, agricultural households found improved seeds from government (36.3 percent of agricultural households who used improved seeds), government and market (23.6 percent), market (18.0 percent), NGOs (16.2 percent) and other place (8.5 percent). For Season B 2017, agricultural households found inorganic fertilizers from government (14.2 percent of agricultural households who used improved seeds), government and market (7.6 percent), market (7.4 percent), NGOs (4.2 percent) and other place (3.4 percent).

3.8.2 Equipment (small and durable tools, and storage facilities) used for agricultural production

Table 48 shows the possession of major small tools used in agricultural households such as hoe, sacks, machete, jerry-can, sickle, basket, bucket, watering can sheet, pick, crop sprayer and wheel barrow. Table 49 shows major durable tools used agricultural households, which are drying ground, storage facilities, animal shed facilities, motorcycle, bicycle, vehicle used for agriculture, peeling machine, motor-pump, barn and milking machine.

Findings from Table 50 show that 13.8 percent of crop-producing households in Season A 2017 and 21.7 percent in Season B 2017 used storage facilities. Vis-à-vis the type of storage facilities, it has been found that 98.6 percent of all agricultural households who reported used storage facilities in Season A 2017, and 99.3 percent in Season B 2017, used traditional owned storage (See Table 51).

3.9 Agricultural practices

Table 52 indicates that 10.1 percent of all agricultural households in Rwanda practiced irrigation during agricultural year 2017. 66.2 percent of agricultural households practiced traditional technique, followed by 24.3 percent with surface irrigation technique, 13.5 percent with flood irrigation, 2.2 percent with sprinkler irrigation and 0.7 percent with drip irrigation. In addition, male-headed agricultural households practice irrigation more, when compared to female-headed agricultural households (11.5 percent versus 6.4 percent). Concerning the source of water used for irrigation (see Table 54), it has been found that major three sources of water were lake/stream water (48.7 percent), followed by underground water (33.1 percent), and valley dam (6.7 percent).

Table 53 shows that 65.7 percent of all agricultural households have practiced anti-erosion control measures. Regarding the type of anti-erosion measures used, 76.0 percent of percent of all agricultural households have practiced anti-erosion control measures used cover plants/grasses, followed by 43.9 percent with trenches, 11.8 percent with beds/ ridges 9.9 percent with progressive terraces and 9.4 percent with radical terraces.

According to the type of the market at which crop producing households sold their produce, Table 55 indicates that majority of households (75.2 percent in season A 2017 and 71.6 percent in Season B 2017) sold their produce at local market, followed by farm gate (25.0 percent in season A 2017 and 26.3 percent in Season B 2017).

3.10 Livestock

The livestock section of this report covers number of households who raised livestock animals, livestock numbers by type and breed, milk production and its use.

3.10.1 Agricultural households raising livestock

Table 56 presents the distribution of livestock-raising households per type of animal. Country wide it was estimated 1.7 million livestock-rearing households at the day of interview. Cattle, goats, hens and pigs were the most commonly raised animals, at 61.0 percent, 53.6 percent, 33.7 percent and 30.6 percent respectively of livestock-raising households. Cattle and sheep-rearing was particularly high in South (71.6 percent and 26.7 percent respectively) and Northern (70.9 percent and 25.2 percent respectively) provinces. Goat-rearing was highest in Eastern province (70.2 percent) and pig-rearing in Southern Province (57.4 percent). Hen-rearing was highest in Kigali City. Raising cattle is higher among male-headed households than female-headed ones (64.6 percent compared to 51.0 percent), as is raising pigs (31.5 percent compared to 28 percent) and hen (36.2 percent compared to 26.7 percent). Besides goat-rearing was higher among female-headed households than male-headed households (60.2 percent compared to 51.2 percent).

Annex A: Persons who contributed to the Agricultural Household Survey 2017

AHS technical coordination

- MWIZERWA Jean Claude, Acting Director of Economic Statistics Unit
- BURAMBA Eric, Agriculture & Environmental Statistics Acting Team Leader
- BIGIRIMANA Florent, Geographic Information Systems Team Leader
- NKUNDIMANA Donath, Data Processing Team Leader

AHS field work coordination

- KAMANZI SHINGIRO Jean Philbert, Research assistant
- MUTEBUTSI Alexis, Research assistant
- MUKAMAZIMPAKA Francine, Perennial crops and horticulture statistician
- UWIZEYIMANA Lambert, Forestry and environmental statistics statistician

AHS data analysis

- BURAMBA Eric, Agriculture & Environmental Statistics Acting Team Leader
- UWAMAHORO Didas, Regional price and economic data collector officer
- MURENZI Rafiki, National account statistician
- IRADUKUNDA Odile, Construction and real estate statistician
- ABAYISENGA Aimable, Regional price and economic data collector officer
- MUVUNYI Issa, Livestock and fisheries production statistician

Report writing

- BURAMBA Eric, Agriculture & Environmental Statistics Acting Team Leader
- UWAMAHORO Didas, Regional price and economic data collector officer

AHS GIS team

- BIZIMUNGU Clément, Field operations Cartographer Officer
- NIYONSENGA J. Claude, GIS staff
- NTAWIHA Athanasie, GIS staff
- IRAMBONA Eddy Marcus, GIS staff
- NIYITEGEKA Beata, Cartographer support staff
- NDAZIGARUYE Alfred, Cartographer support staff

AHS data processing

- SEBAHIRE Jean Népomuscène, Food Security & Agriculture Surveys data processing Officer
- MUTEBUTSI Alexis, Research assistant
- HAGENIMANA Damascène, IT Support staff
- ISIMBI Bélise, IT Support staff

Sample Design

- KAMANA Roger, Statistical Methods, Sampling and Classification Research Statistician Team Leader
- BURAMBA Eric; Agriculture and environmental Statistics Acting Team Leader

Editing and designing

- NYIRIMANZI Jean Claude, Research, Publication and Dissemination Team Leader
